                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ð
                                                                                                                                                                                      The present sequence represents a chimeric antisense oligonucleotide targeted to human microsomal prostaglandin E2 synthase (mpGES-1). The human megES-1 gene is located on chromosome 9, more specifically to open is located on chromosome 9, more specifically to open is located on chromosome 9, more specifically to open in the present invention also describes: (1) antisense compounds, having a sequence comprising 8-30 bp targeted to a nucleic acid encoding mpGES-1, which specifically hybridise with the nucleic acid encoding inhibits its expression; (2) a method of inhibiting the expression of mpGES-1 in cells or tissues; and (3) a method of treating an animal condition associated with mpGES-1. MpGES-1 chimeric antidiabetic, immunomodulator, cardiant, neuroprotective, vasotropic, antidiamaticity, namenomodulator, and cardiovascular activities, and can be used as mpGES-1 inhibitors and in gene therapy. The antisense compound to be used as mpGES-1 inhibitors and in gene therapy. The antisense compound can be used as used for preparing a composition for treating a disease or condition associated with mpGES-1 e.g., inflammation, Alabeimer's condition associated with mpGES-1 e.g., inflammation, Alabeimer's condition associated with mpGES-1 e.g., inflammation, and injury, or oppthhalmic, immunological, cardiovascular or neurological disorder.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         chimeric; antisense oligonuclectide; phosphorothioate; human; microsomal prostaglandin E2 synthase; mPGES-1; mPGES-1 inhibitor; microsomal prostaglandin E2 synthase; inhibitor; cytostatic; antidiabetic; immunomodulator; cardiant; neuroprotective; antiinflammatory; neuroprotective; nootropic; antiarthritic; vasotropic; ophthalmological; immunomodulatory; cardiovascular; gene therapy; inflammation; Alzheimer; diabetes; cancer; ischaemia; reperfusion injury; ophthalmic disorder; immunological disorder; cardiovascular disorder; neurological disorder; ss.

The present sequence represents a chimeric antisense oligonucleotide targeted to human microsomal prostaglandin E2 synthase (mPGES-1). The human mPGES-1 gene is located on chromosome 9, more specifically to pag4.3. The present invention also describes: (1) antisense compounds, having a sequence comprising 8-30 bp targeted to a nucleic acid mPGES-1 and inhibits its expression; (2) a method of inhibiting the expression of mPGES-1 in cells or tissues; and (3) a method of treating an animal companies oligonucleotides and antisense compounds have cytostatic, antisense oligonucleotides and antisense compounds have cytostatic, antisinglammatory, neuroprotective, nootropic, antianflammatory, neuroprotective, nootropic, antianflammatory, neuroprotective, nootropic, antianflammatory, neuroprotective, and candidate as mPGES-1 inhibitors and in gene therapy. The antisense compound can be used for preparing a composition for treating a disease or condition associated with mPGES-1 e.g., inflammation, Althebiaer's
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         chimeric; antisense oligonucleotide; phosphorothioate; human; microsomal prostaglandin E2 synthase; mPGES-1; mPGES-1 inhibitor; microsomal prostaglandin E2 synthase inhibitor; cytostatic; antidiabetic; immunomodulator; cardiant; neuroprotective; antiinflammatory;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             disease, arthritis, diabetes, cancer, ischaemia or reperfusion injury, or ophthalmic, immunological, cardiovascular or neurological disorder.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New antisense compound, having a sequence targeted to a nucleic acid encoding mPGES-1, useful for preparing a composition for treating e.g., inflammation, Alzheimer's disease, arthritis, diabetes, cancer or

The present sequence represents a chimeric antisense oligonucleotide targeted to human microsomal prostaglandin E2 synthase (mPGES-1). The human mpGES-1 gene is a located on chromosome 9, more specifically to off an expecifically the present invention also describes: (1) antisense compounds, having a sequence comprising 8-30 bp targeted to a nucleic acid encoding mPGES-1, which specifically hybridise with the mucleic acid encoding inhibits its expression; (2) a method of inhibiting the expression of mPGES-1 in cells or tissues; and (3) a method of treating an animal antisense oligonucleotides and antisense compounds have cytostatic, antidiabbetic, immunomodulator, cardiant, neuroprotective, antidiabbetic, immunomodulatory and cardiant, neuroprotective, antidiabbetic, immunomodulatory and cardiant activities, and can be used as mPGES-1 inhibitors and in gene therapy. The antisense compound can be used for preparing a composition for treating a disease or condition associated with mpGES-1 e.g., inflammation, sand, and sand and sand antisense of condition associated with mpGES-1 e.g., inflammation, sand, san

The present sequence represents a chimeric antisense oligonucleotide targeted to human microsomal prostaglandin E2 synthase (mPGBS-1). The human mPGBS-1 gene is located on chromosome 9, more specifically to 9934.3. The present invention also describes: (1) antisense compounds, having a sequence comprising 8-30 bp targeted to a nucleic acid encoding mPGBS-1, which specifically hybridise with the nucleic acid mPGBS-1 and inhibits its expression; (2) a method of inhibiting the expression of mPGBS-1 in cells or tissues; and (3) a method of treating an animal atsisense or condition associated with mPGES-1. MPGBS-1 chimeric antisense oligonucleotides and antisense compounds have cytostatic, antidiabetic, immunomodulator, cardiant, neuroprotective, vasotropic, antiinflammatory, neuroprotective, nootropic, antiarthritic, vasotropic,

The present sequence represents a chimeric antisense oligonucleotide targeted to human microsomal prostaglandin E2 synthase (meGES-1). The human meGES-1 special socated on chromosome 9, more specifically to human meGES-1 special socated on chromosome 9, more specifically to antisense compounds, 944.3. The present invention also describes: (1) antisense compounds, compGES-1, which specifically hybridise with the nucleic acid meGES-1 and inhibits its expression; (2) a method of inhibiting the expression of meGES-1 in cells or tissues; and (3) a method of treating an animal compounds a disease or condition associated with meGES-1. MeGES-1 chimeric antisense oligonucleotides and antisense compounds have cytostatic, antisense oligonucleotides and antisense compounds have cytostatic, contininamatory, neuroprotective, nootropic, antistriatic, vasotropic, antistrialmamological, immunomodulatory and cardiovascular activities, and can be used as meGES-1 inhibitors and in gene therapy. The antisense compound can be used as meGES-1 inhibitors and in gene therapy. The antisense compound con be used as meGES-1 inhibitors and in gene therapy. The antisense compound con be used as meGES-1 inhibitors and in gene therapy. Alzheimer's condition associated with meGES-1 e.g., inflammation, Alzheimer's disease, arthritis, diabetes, cancer, ischaemia or reperfusion injury, or condition associated with meGES-1 e.g., inflammation injury, or condition immunological, cardiovascular or neurological disorder.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       chimeric; antisense oligonucleotide; phosphorothioate; human; microsomal prostaglandin E2 synthase; mPGES-1; mPGES-1 inhibitor; microsomal prostaglandin E2 synthase; inhibitor; eyrostatic; antidiabetic; immunomodulator; cardiant; neuroprotective; antiinflammatory; neuroprotective; antiarthritic; vasotropic; ophthalmological; immunomodulatory; cardiovascular; gene therapy; inflammation; Alzheimer; disease; arthritis; diabetes; cancer; ischaemia; reperfusion injury; ophthalmic disorder; immunological disorder; cardiovascular disorder; neurological disorder; se.

The present sequence represents a chimeric antisense oligonucleotide targeted to human microsomal prostaglandin E2 synthase (mpGES-1). The human mpGES-1 gene is located on chromosome 9, more specifically to 9434.3. The present invention also describes: (1) antisense compounds, having a sequence comprising 8-10 bp targeted to a nucleic acid encoding mpGES-1, which specifically hybridise with the nucleic acid encoding inhibite its expression; (2) a method of inhibiting the expression of mpGES-1 in cells or tissues; and (3) a method of treating an animal national adjouncleotides and antisense compounds have cytostatic, antidiabetic, immunomodulator, cardiant, neuroprotective, optibalmological, immunomodulatory neuroprotective, notropic, antidiamatory, neuroprotective, notropic, antidiamatory interoperating a composition be used as mpGES-1 inhibitors and in gene therapy. The antisense compound can be used for preparing a composition for treating a disease or condition associated with mpGES-1 e.g. inflammation, Alzheimer's disease, arthritis, diabetes, cancer, isohaemia or reperfusion injury, or ophthalmic, immunological, cardiovascular or neurological disorder.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö

The present sequence represents a chimeric antisense oligonucleotide targeted to human microsomal prostaglandin E2 synthase (mPGES-1). The human mpGES-1 gene is located on chromosome 9, more specifically to offer an engine of antisense compounds, having a sequence comprising 8-30 bp targeted to a nucleic acid encoding compense. Which specifically hybridise with the nucleic acid encoding inhibits its expression; (2) a method of inhibiting the expression of mPGES-1 in cells or tissues; and (3) a method of treating an animal companies of antisense oligonucleotides and antisense compounds have cytostatic, antishabetic, immunomodulator, cardiant, neuroprotective, antishabetic, immunomodulatory and cardiant, neuroprotective, antishabetic, immunomodulatory and cardiant, neuroprotective, cophthalmological, immunomodulatory and cardiavascular activities, and can be used for preparing a omposition for treating a disease or condition associated with mPGES-1 e.g., inflammation, Altheimer's conditions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö

Claim 4; SEQ ID NO 194; 132pp; English.

XX
The present sequence represents a chimeric antisense oligonucleotide
targeted to human microsomal prostaglandin E2 synthase (mCGES-1). The
thuman mPGES-1 gene is located on chromosome 9, more specifically to
the present invention also describes: (1) antisense compounds,
companies, which specifically hybridise with the nucleic acid encoding
mPGES-1, which specifically hybridise with the nucleic acid mPGES-1 and
inhibits its expression; (2) a method of inhibiting the expression of
inhibits its expression; (2) a method of inhibiting the expression of
inhibits its expression; (2) a method of inhibiting the expression of
inhibits its expression; (2) a method of inhibiting the expression of
antisense oligonucleotides and antisense compounds have cytostatic,
antisense oligonucleotides and antisense compounds have cytostatic,
antisflammatory, neuroprotective, nootropic, antiathritic, vasotropic,
antisflammatory, neuroprotective, nootropic, antiathritic, vasotropic,
ophthalmological, immunomodulatory and cardiovascular activities, and can
be used as mPGES-1 inhibitors and in gene therapy. The antisense compound
can be used for preparing a composition for treating a disease or
condition associated with mPGES-1 e.g., inflammation, Alzheimer's
disease, arthritis, diabetes, cancer, ischaemia or reperfusion injury, or
cophthalmic, immunological, cardiovascular or neurological disorder.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present sequence represents a chimeric antisense oligonucleotide targeted to human microsomal prostaglandin E2 synthase (mPGES-1). The human mpGES-1 gene is located on chromosome 9, more specifically to 9d34.3. The present invention also describes: (1) antisense compounds, having a sequence comprising 8-30 bp targeted to a nucleic acid encoding
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New antisense compound, having a sequence targeted to a nucleic acid encoding mPGES-1, useful for preparing a composition for treating e.g., inflammation, Alzheimer's disease, arthritis, diabetes, cancer or

mPGES-1, which specifically hybridise with the nucleic acid mPGES-1 and inhibits its expression; (2) a method of inhibiting the expression of mPGES-1 in cells or tissues; and (3) a method of treating an animal having a disease or condition associated with mPGES-1. MPGES-1 chimeric antisense oligonucleotides and antisense compounds have cytostatic, antidialentic, immunomdulator, cardiant, neuroprotective, ophthalmological, immunomdulatory and cardiovascular activities, and can be used for preparing a composition for treating a disease or can be used for preparing a composition for treating a disease or condition associated with mPGES-1 e.g., inflammation, Alzheimer's disease, arthritis, diabetes, cancer, ischaemia or reperfusion injury, or ophthalmic, immunological, cardiovascular or neurological disorder.
                                                                                                                                                                                                                                                                                                                                  ö

The present sequence represents a chimeric antisense oligonucleotide targeted to human microsomal prostaglandin E2 synthase (mPGES-1). The human mepgES-1 gene is located on chromosome 9, more specifically to office the present invention also describes: (1) antisense compounds, having a sequence comprising 8-30 bp targeted to a nucleic acid encoding mPGES-1, which specifically hybridise with the nucleic acid encoding inhibits its expression; (2) a method of inhibiting the expression of mPGES-1 in cells or tissues; and (3) a method of treating an animal having a disease or condition associated with mPGES-1. MPGES-1 chimeric antisense oligonucleotides and antisense compounds have cytostatic, antialabetic, immunomodulator, cardiant, neuroprotective, vasotropic, antinflammatory, neuroprotective, nootropic, antiantises, and can can be used as mPGES-1 inhibitors and in gene therapy. The antisense compound can be used for preparing a composition for treating a disease or condition associated with mPGES-1 e.g., inflammation, Alzheimer's

The invention describes a reagent (I) comprising a particle bound to at least one Raman label and a specific binding member, where the Raman cartivated to provide a surface-enhanced Raman scattering (SERS) effect or comprising a specific binding member having two or more different Raman labels bound to it. Also described are: a test kit (II), comprising (I) in one container and a silver, gold or copper Raman container and a silver, gold or copper Raman compares that in another container, and a fibre optic detection device (III), having a bundle of optical fibres terminating with ends of the optical fibre, where a several of the optical fibres have (I) located at the ends of the optical fibre. (I) is useful for: detecting for the presence or absence of one or more target analytes in a sample, the carget analytes having at least two binding sites; detecting the presence or absence of one or more target analytes in a sample, the sequence or absence acid aving at least two binding sites; detecting the presence or absence acid aving at least two portions; and for sereening one or more molecules to determine whether the molecule is a ligand to one or more specific receptors. This sequence represents an oligonucleotide associated with the SERS-based detection analyte detection method.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
Reagent, useful for detecting target analyte e.g., nucleic acid, comprising particle having bound to at least one Raman label, which can be activated to provide surface-enhanced Raman scattering effect, and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Nucleic acid detection, nanoparticle-oligonucleotide conjugate; genetic disease; bacterial infection, viral infection, forensic; DNA sequencing; paternity testing; linking oligonucleotide; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ..

Line inventions to tailly a considered of detecting a nucleic acid with at conjugate, contacting the nucleic acid and nanoparticle-oligonucleotide conjugate, contacting the nucleic acid and nanoparticles to allow the providisation of the oligonucleotides with the two or more portions of the nucleic acid and observing a detectable change brought about by the nucleic acid and observing a detectable change brought about by hybridisation. The oligonucleotides have a sequence complementary to the hybridisation. The aligonucleotides have a sequence complementary to the sequence of at least two portions of the nucleic acid. Hybridisation of the oligonucleotides on the nanoparticles with the nucleic acid results in a detectable change. The method is used for detection and separation of nucleic acids (e.g. viral DNA, a gene associated with a disease.)

Cf nucleic acids (e.g. viral DNA, a gene associated with a disease.)

Cf nucleic acids (e.g. viral DNA, synthetic DNA, structurally-modified DNA, DNA from biological sources or PCR products) for diagnosis of various diseases (such as genetic diseases, bacterial infections and viral confections) and for forensics, DNA sequencing, paternity testing and monitoring gene therapy. This sequence represents a linking and conformation.
                                                    articles useful for detection and separation of nucleic acids e.g associated with disease, in a diagnostic assay, comprise several

conjugate, contacting the nucleic acid and nanoparticle-oligonuclectide conjugate, contacting the nucleic acid and nanoparticles to allow hybridisation of the oligonuclectides with the two or more portions of the nucleic acid and observing a detectable change brought about by hybridisation. The oligonuclectides have a sequence complementary to the sequence of at least two portions of the nucleic acid. Hybridisation of the oligonuclectides on the nanoparticles with the nucleic acid results in a detectable change. The method is used for detection and separation of the oligonuclectides on the method is used for detection and separation. Of nucleic acids (e.g. viral DNA, a gene associated with a disease, bacterial DNA, fungal DNA, synthetic DNA, structurally-modified DNA, DNA from biological sources or FCR products) for diagnosis of various diseases (such as genetic diseases, bacterial infections and viral monitoring gene therapy. This sequence represents a linking and monitoring diseases.
                                                                                                              Nanoparticles useful for detection and separation of nucleic acids e.g. genes associated with disease, in a diagnostic assay, comprise several oligonucleotides attached to them.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to a method of detecting a nucleic acid with at

The invention fatares to preparing a (vertexate) man size metil factor (SCP) polypeptide comprising growing host cells transformed or transfected with DNA encoding a human SCP that stimulates growth of heematopoietic progenitor cells unrised included is a recombinant host cell polypeptide produced. Also included is a recombinant host cell caracter of transfermed or transferred with an expression control sequence, and isolating the operatively linked to a mexpression control sequence, and isolating the cransferred of transferred of the vertebrate SCP polypeptide encoding DNA operatively linked to a member of the vertebrate SCF polypeptide in the host cell. Disclosed as new are rated the vertebrate SCF polypeptide in the host cell. Disclosed as new are rated to the vertebrate SCF polypeptide in the host cell. Disclosed as new are rated to recombinantly expressed SCF protein fragments. The expression of sequences are useful for effecting the large scale synthesis of SCF by a current of sequences are useful for effecting the large scale synthesis of SCF by a current of sequences are useful for effecting the large scale synthesis of SCF by a current of such host cells, and new and useful viral and circular plasmid DNA vectors, new and useful as and circular plasmid DNA vectors. The DNA sequences are also useful as and its related probes; in soletting human spendic DNA encoding SCF, in methods for production of SCF and SCF products in quantity. The SCF is soletting for production of SCF and SCF products in quantity. The SCF is useful for treating heematopoletic disorders, e.g., aplastic anaemia, consistent of story productions and sequences are used. The scription of sequences are used. The scription of sequences are used. The scription of sequences of productions, and the sequences are subscriptions, and sequences are subscriptions. The scriptions are subscriptions, and sequences are also useful for treating neurological damage, infertility states, intentinal damage for each inmune system for tighting neoplasia, cau

The invention relates to a novel method for isolating molecules using a micro-channel. The molecules are isolated by introducing a mixed solution having two types of solute molecules differing in molecular weight into a micro flow path, to form a non turbulent flow, and providing physical action to the molecules by changing the flow state, thus causing different behaviours among different solute molecules, where the different behaviour enables uneven distribution of specific kinds of molecules in the flow path, causing separation of specific kinds of invention further comprises molecule separation of specific kinds of unbettact with a micro flow path, having one or more curved portions, a sample intake unit at one side and a sample removal opening at the other side, and a physical property detection sensor arranged inside the curved portion. The method is useful for isolating molecules, e.g. polymer compounds, DNA or proteins. The method enables might and efficient separation of molecules by utilising specific flow behaviour in a non turbulent flow, in a micro flow path, where a large number of samples can be processed. This polymucleotide sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                                                                                                                                                                                                                                                                                Isolating molecules e.g., DNA, by introducing solution with two types of solute molecules into micro flow path to form non turbulent flow, providing physical action to molecule causing difference in flow
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Stem cell factor; SCF; haematopoietic; HT1080 fibrosarcoma cell line;

```
The invention relates to a stem cell factor (SCF) such as non-naturally-
ccurring SCF having an amino acid sequence sufficiently duplicative of
that of naturally occurring SCF to allow possession of a haemacopoletic
biological activity of naturally occurring stem cell factor, or naturally
ccurring SCF. Also included are an isolated DNA sequence for use in
securing SCF. Also included are an isolated DNA sequence for use in
ccurring expression in a prokaryotic or eukaryotic host cell of non-
cc naturally occurring SCF, a prokaryotic or eukaryotic host cell.
cransformed or transfected with the DNA, a polypeptide product of the
expression of the DNA in a prokaryotic or eukaryotic host
cc expression of the DNA in a prokaryotic or eukaryotic host
cc expression of non-naturally occurring SCF, a DNA sequence coding for a
polypeptide fragment or polypeptide analogue of naturally-occurring stem
cc expression of non-naturally occurring SCF, a DNA sequence coding for a
polypeptide fragment or polypeptide analogue of naturally-occurring stem
cc expression of non-naturally occurring SCF, a DNA sequence coding for a
ccll factor, a biologically functional plasmid or viral DNA vector
ccll factor, a biologically the DNA, a polypeptide having part
cc carcinoma cell line, or human SCF cDNA obtained from HT1080
cc fibrosarcoma cell line, or human SCF cDNA obtained from HT1080
cc fibrosarcoma cell line, or human SCF cDNA obtained from HT1080
cc fibrosarcoma cell line, or human SCF cDNA obtained from HT1080
cc fibrosarcoma cell line, or human SCF cDNA obtained from Gradiact
cc carcinoma cell line, or mammal. SCF is useful for treating patients
cc carcinoma cell line, and enhancing engraftment of bone marrow
during transplantation in a mammal. SCF is useful for treating patients
cc recovery in treatment of radiation, chemical, or chemotherapeutic in paramally effective doses of SCF. SCF is useful for treating
cc with therapeutically effective doses of SCF. SCF is useful for treating
cc intestinal damage, and a myeloproliferative disor
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Novel stem cell factor (SCF) such as non-naturally-occurring SCF or naturally occurring SCF, useful for treating leukopenia, thrombocytopenia, anemia, and enhancing engraftment of bone marrow during
                                                                                                                                                                                                                                                                                                                                                                        Martin FH;

transfecting early haematopoietic progenitor cells with a gene which involves culturing early haematopoietic progenitor cells with SCF, and transfecting the cultured cells with a gene. SCF is useful for transfecting the cultured cells with SCF, transfecting the cultured cells with a gene, and administering the cultured cell to the mammal. SCF is useful for treating various haematopoietic disorders, aplastic anaemia, myelofibrosis, myelosclerosis, osteopetrosis, metastatic carcinoma, acute disease, Niemann-Pick disease, Diamond-Blackfan anaemia (DBA), Fanconi's anaemia. SCF is useful for enhancing the efficiency of gene therapy, for enhancing haematopoietic recovery after acute blood loss. The present

The present invention provides methods of detecting nucleic acids. The method of the invention comprises contacting a nucleic acid with a comparises contacting a nucleic acid with a compariate including oligonucleotides under conditions to allow hybridisation of oligonucleotides on the substrate, contacting nucleic acid bound to the substrate with nanoparticles comprising of conductivity. The invention is useful for detecting nucleic acids for the conductivity. The invention is useful for detecting nucleic acids for the diagnosis of genetic diseases such as cystic fibrosis, buchenne muscular conductivity. The invention is useful for detecting nucleic acids for the diagnosis of genetic diseases such as cystic fibrosis, buchenne muscular cuch stuberculosis, Lyme disease, Helicobacter pylori infections.

CE Scherichia coli infections, viral diseases such as human immunodeficiency and Salmonella infections, viral diseases such as human immunodeficiency disease virus, (RIV), heptitis virus, herpes virus, cytomegalovirus and Epstein-Barr virus, sexually transmitted disease such as genorrhoea The invention is also useful in forensics, DNA sequencing, paternity testing, cell line authentication and gene therapy. The present sequence is a thiol-modified coligonucleotide is used to detect the nanoparticle conjugates. This oligonucleotide is used to detect the effect of coadsorbed diluent oligonucleotides.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Suppressing allergies, including asthma, rhinitis, urticaria and atopic dermatitis, in a subject, comprises administering a first and second dose of an immunostimulatory nucleic acid.

respiratory syndrome (SARS) coronavirus. The polypeptides include spike (S or E2), env (E or SM), membrane (M or E1), hemagglutinin-esterase (HE or E3), and nucleocapsid (N) polypeptides, and the ORFiab and ORFiab (replicase) polypeptides and their proteolytic fragments. The invention also relates to antibodies which recognise the polypeptides; nucleic acids encoding the SARS virus polypeptides; primers specific for SARS virus nucleic acids adouble-stranded RNA molecule 10-30 nucleotides in length
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      οĘ

cc which is able to inactivate the SARS virus in a mammalian cell; an expression construct for recombinant expression of a SARS virus spike protein; a viral vector for in vivo delivery of a SARS virus polypeptide-cc encoding nucleic acid; and a mammalian cell line stably expressing a SARS viral antigen. The invention additionally provides a vaccine for the treatment or prevention of SARS comprising an inactivated SARS virus, a crimated SARS virus, a crimated SARS virus, a split SARS virus and pha-virus or preparation, or at least one purified SARS virus antigens; methods of preparation, or at least one purified SARS virus antigens; methods of comprising one or more SARS virus antigens; and a vaccine comprising one or more SARS virus antigens and one or more SARS virus antigens and one or more satisfying a therapeutically active agent by measuring the effect of the comprising one or more satis virus polypeptides and concluded acids can be used in the preparation and manufacture of vaccines for the treatment or prevention of SARS virus spolypeptides, antibodies against them, and SARS virus specific primers and kits containing them are useful for diagnosing or identifying the presence of SARS in a biological sample. The present sequence represente a primer for SARS in a biological sample. The present sequence represente a primer for this patent did not form part of the printed specification, but was containing the interparation of SARS genomic RNA. Note: The sequence data

The invention relates to a novel nanoparticle having oligonucleotides attached thereto, comprising at least one type of recognition oligonucleotides, each having a spacer portion bound to the nanoparticle and a recognition portion having a sequence complementary to portion(s) of sequence of nucleic acid or another oligonucleotide. In the presence conditions, the nanoparticle forms a complex with the nucleic acid or another oligonucleotide and under hybridization conditions, the nanoparticle forms a complex with the nucleic acid or another oligonucleotide. The complex has a sharp melting profile and an increased melting temperature, relative to a melting profile and an increased melting temperature, relative to a melting profile and a not another oligonucleotide and an unlabeled or fluorophore-labeled or insertions, deletions, and/or mismatches in the nucleic acid or another oligonucleotide with a sequence identical to the oligonucleotides bound to the nanoparticle. The nanoparticles of the invention are useful for detecting nucleic acids for diagnosis of genetic, bacterial, and viral diseases. The nanoparticle is stable at elevated temperature and high salt concentration. The present sequence is used in the exemplification of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Novel glycosyltransferase capable of transferring N-acetyl-D-galactosamine (GalNAc) residue to GalNAc receptor substrate from GalNAc donor substrate, useful in screening substances that promotes/inhibits glycosyltransferase activity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     glycosyltransferase; N-acetyl-D-galactosamine; GalNAc; screening; ss;
least one type of recognition oligonucleotides, each having spacer portion and recognition portion.

The invention relates to a novel glycosyltransferase capable of transferring an N-acetyl-D-galactosamine (GalNAc) residue to a GalNAc creeptor substrate from a GalNAc donor substrate: The glycosyltransferase comprises a polypeptide having sequence AU94808 containing amino acids are in the specification, or AD94808 in which one or more amino acids are substituted, deleted, inserted or rearranged. The invention further comprises: a nucleic acid encoding the 601 amino acid glycosyltransferase comprises: a nucleic acid encoding the 601 amino acid glycosyltransferase comprises: a nucleic acid sequence AD94807 having bases 12-1806 or 1-1806 of a fully defined sequence AD94807 having bases 12-1806 or 1-1806 of a fully defined sequence Complementary to AD94807; a nucleic acid capable of hybridizing under stringent conditions, with the nucleic acid capable of hybridizing under stringent conditions, with the nucleic acid capable of hybridizing the glycosyltransferase encoding DNA or its complementary sequence complementary to the 1806 bp continuody capable of specifically recognizing the glycosyltransferase protein; an active regulator of the glycosyltransferase protein; an active regulator of the glycosyltransferase protein; an active regulator of the glycosyltransferase protein as an active regulator of the glycosyltransferase protein as an active ingredient. The glycosyltransferase complementary plan is useful as a probe for detecting in vivo expression of the glycosyltransferase. The glycosyltransferase complementary of glycosyltransferase complementary plan is useful as a probe for detecting in vivo expression of the glycosyltransferase complementary is useful as a cradent or the glycosyltransferase protein, is useful as a cradent or the glycosyltransferase protein, is useful as cative regulator of the glycosyltransferase protein, is useful as cative regulator of the glycosyltransferase protein, is useful as cative regulator of the glycosyltransferase protein, is useful as cative regulator of the glycosyltransferase ö glycosyltransferase protein. The glycosyltransferase protein is capable of transferring GalnAc residue to a GalnAc receptor substrate from a GalnAc donor substrate. This polynucleotide sequence represents a primer used in the exemplification of the invention. Gaps ö 0.7%; Score 20; DB 1; Length 20; 100.0%; Pred. The invention relates to detecting or quantifying gene expression in a sample having unlabeled target nucleic acids. The method involves can be abstrate having types of capture nucleic acid sequences attached to it in an array for the detection of multiple portions of a target nucleic acid, the detection of multiple different target nucleic acids, or both, providing namoparticles having a sequence of it, the oligonucleotides bound to the namoparticles having a sequence that is complementary to at least a portion of the oligonucleotide tail; contacting the sample, the substrate, and the namoparticles, the contacting under conditions for hybridization of the target nucleic acids to the capture nucleic acid sequences bound to the substrate and hybridization of the target nucleic acids to the namoparticles, and observing a detectable change. The target cDNAs, namoparticles, and observing a detectable change. The target cDNAs with the oligonucleotides bound to the substrate are contacted simultaneously under conditions conditions councied acid sequences comprises and with the capture nucleic acid sequences comprises and oligonucleotide, cDNA, or genomic sequence fragment. The method is useful for detecting/quantifying global sequence fragment. The method is useful for detecting/quantifying global captaneously the present sequence represent abeling and target captare amplification. The present sequence represents a detection which in a sample of unlabeled target nucleic acids acids acids associated with fluorescent labeling and target and another sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           amplification. The present sequence represents a detection probe that can be used to detect target RNA sequences. The probe comprise a steroid disulfide linker at the 5'-end followed by a recognition sequence.
                                                                            Detecting/quantifying gene expression in a sample of unlabeled target nucleic acids by contacting the sample, a substrate having capture nucleic acid sequences and nanoparticles having bound oligonucleotides
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  0.7%; Score 20; DB 1; Length 20; 100.0%; Pred. ```
The invention relates to detecting or quantifying gene expression in a sample having unlabeled target nucleic acids. The method involves C sample having unlabeled target nucleic acids. The method involves attached to it in an array for the detection of multiple different target nucleic acids, the detection of multiple different target nucleic acids, to both providing nanoparticles having oligonucleotides bound to it, the Oligonucleotides bound to the annoparticles having a sequence that is complementary to at least a portion of the oligonucleotide bound to contacting the sample, the substrate, and the nanoparticles, the contacting occurring under conditions for hybridization of the target nucleic acids to the contacting a detectable change. The target cDNAs, c nanoparticles and substrate are contacted simultaneously under conditions effective for hybridization of the target cDNAs with the oligonucleotides bound to the substrate are contacted simultaneously under conditions effective for hybridization of the target cDNAs with the oligonucleotides bound to the substrate. The nanoparticles and with the capture nucleic acid sequences comprise an oligonucleotide, cDNA, or genomic condition in a sample of unlabeled target nucleic acid sequences comprise an oligonucleotide, cDNA, or genomic condition. The present sequence represents a detection probe that can condition and incompanies. The problems associated with fluorescent labeling and target can amplification. The present sequences are presented and target can advanced to detect target RNA sequences. The probe companies as a terroid and advanced and advanced to detect target RNA sequences. The probe companies as a terroid and advanced conditions and target can be used to detect target RNA sequences. The probe companies as a terroid and advanced conditions as a person of the condition and target can be used to detect target RNA sequences. The probe companies as a person of the condition and advanced condition and advanced conditions. The proper companies and advanc

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to an oligonucleotide molecule (ON) labeled with several fluorophores of one or more types embedded in its backbone, where one or more of the fluorophores is not located at either the 3' or 5' terminus of ON. ON is useful for sequencing nucleic molecules. ON is useful for detecting biological molecules e.g., antibody, antigen, avidin, protein, peptide, bacteria, virus, blood cell or hormone. ON is
                                                                                                                                                                                                       The invention relates to an oligonucleotide molecule (ON) labeled with several fluorophores of one or more types embedded in its backbone, where one or more of the fluorophores is not located at either the 3' or 5' terminus of ON. ON is useful for sequencing nucleic molecules. ON is useful for detecting biological molecules e.g., antibody, antigen, avidin, protein, peptide, bacteria, virus, blood cell or hormone. ON is capable of providing strong fluorescence signals at different wavelengths. This sequence corresponds to an example of an oligonucleotide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         el oligonucleotide molecule labeled with several fluorophores, useful detecting biological molecules e.g., antibody, antigen, avidin or

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to a method of discriminating the responsiveness of an individual to taxanes. The method is useful for discriminating the responsiveness of an individual e.g. a breast cancer patient to taxanes, where the sample is a primary breast cancer tissue or local recurrent breast cancer tissue. The method discriminates the responsiveness of a patient with respect to taxane and thus contributes to the treatment of cancer. The present sequence represents a taxane discriminating expressed
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Discriminating responsiveness of individual to taxanes, by detecting expression of 10 or more genes e.g., L43578, M33882, U32944 in sample derived from individual and determining responsiveness of sample based on
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps

The present invention relates to a method (M1) for stimulating proliferation of melanocyte cells in a human. (M1) involves administering or stem Cell Factor (SCF) protefail, or its biologically active fragments that stimulates growth of melanocyte cells, and optionally a carrier, to the human. The SCF is covalently conjugated to a water soluble polymer of the human. The SCF is covalently conjugated to a water soluble polymer of the proderings solved as early hematopoietic progenitor cells that primitive progenitors such as early hematopoietic progenitor cells that primitive progenitors such as early hematopoietic stem cells that are capable of maturing to erythroid, megakaryocyte, granulocyte, lymphocyte and macrophage cells, and non-hematopoietic stem cells such as neural stem cells and primordial garm stem cells. (M1) is useful in accelerating bone marrow regeneration, and in augmenting T cell contacted by a reduction in functional marrow mass due to toxic, radiant or immunological injury. (M1) is useful in treating ADDS, aplastic anemia, parroyemal nocturnal hemoglobinaria, myelogibioposis,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     myelosclerosis, osteoperrosis, metastatic carcinoma, acute lenkemia, multiple myeloma, Hodgkin's disease, lymphoma, Gaucher's disease, Niemann Pick disease, congestive splenomegaly, Kalaazar, sarcoidosis, primary splenic pancytopenia, disseminated fungus disease, fulminating septicemia, malaria, vitamin B12 and folic acid deficiency disease, pridoxine deficiency disease, and hypoigmentation discorders such as piebaldism and vitiligo. (M1) is useful in treating infertility states, intestinal damage resulting from irradiation or chemotherapy, and stem
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Stimulating proliferation of melanocyte cells in human, involves administering stem cell factor polypeptide or its biologically active fragments stimulating growth of melanocyte cells, and optionally carrier,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present invention relates to the Zea mays 1-Aminocyclopropane-1-Carboxylate (ACC) oxidase, ACC synthase, ACC deaminase, ethylene response sensor (ERS), ethylene resistant (ETR) and ethylene insensitive (EIN) proteins and their DNA. The invention is useful in plant genetic engineering for producing green leaves in maize plants. The present sequence is the dT(20) primer used in ACC oxidase, ACC synthase, ACC deaminase, ERS, ETR and EIN cDNA synthesis.
                 primary thrombocythemia and acute leukemia. (M1) is useful in expanding searly hematopoietic progenitors in syngencic, allogencic or autoblogous bone marrow transplantation, and in enhancing the efficacy of genetherapy. The present sequence is a PCR primer used in an example from the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New nucleic acid, e.g. 1-Aminocyclopropane-1-Carboxylate oxidase or ethylene insensitive, useful for producing green leaves in maize plants.

The present invention relates to a method of stimulating growth of stromal cells in a human. The method involves administering to the human are cell factor (SCP) polypeptide and coptionally a pharmaceutically acceptable carrier. The invention is useful for treating immune disorders such as (acquired immune deficiency syndrome, severe combined immunodeficiency), genetic disorder (such as niemann pick disease), hematological disease (such as multiple myeloma, nodgkins disease, spleen disease, anemia), cancers (such as multiple myeloma, lymphoma), neurological disease (such as niemann pick disease), infection (such as Leishmania donovani infection), hypopigmentation disorders (such as piebaldism and vittligo), in the treatment of infertility states and for treating intestinal damage resulting from irradiation or chemotherapy and inflammation (such as sarcoidosis). The invention is also useful in gene therapy and SCF therapy. The present construction is also useful in gene therapy and SCF therapy. The cloning
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Stimulating growth of stromal cells for treating AIDS or severe combined immunodeficiency states in human, primary splenic pancytopenia, miliary tuberculosis, by administering human stem cell factor polypeptide and carrier to human.

Amplifying unknown nucleotide sequence adjacent to known nucleotide sequence, involves performing primary amplification of unknown nucleotide sequence using DNA walking annealing control primer and first target-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to a method of amplifying an unknown nucleotide sequence adjacent to a known nucleotide sequence, comprising performing a primary amplification of the unknown nucleotide sequence using a DNA walking annealing control primer and a first target-specific primer by performing a first- and second-stage amplification of the unknown nucleotide sequence. The invention also relates to a DNA walking annealing control primer for amplifying an unknown nucleotide sequence adjacent to a known sequence of a DNA walking annealing control primer. This sequence represents a synthetic RT-PCR primer of the invention.
                                                                                                                                                                                                                             DNA amplification; RT-PCR; primer; 88; reverse transcriptase PCR.

The invention relates to a method for modulating, in a host cell, a protein-protein interaction between a first protein which is PRAK (P38-cegulated/activated protein kinase or MAPKAPK5) and a second protein which is ERK3 (extracellular signal-regulated kinase 3). The method comprises administering to the cell a compound capable of modulating the protein-protein interaction. The method is useful in modulating in a host call a protein-protein which is ERK3 for treating inflammation or inflammatory disorders, e.g., asthma, rheumatoid arthritis, juvenile chronic arthritis, myositis, Crohn's disease, gastritis, colitis, unflammatory disease, proteitis, pelvic inflammatory disease, systemic lupus erythematosus, rhinitis, colitis, inflammatory disease, systemic lupus erythematosus, rhinitis, conjunctivitis, solaritis, chronic inflammatory polyneuropathy, Tertiary Lyme disease, psoriais, dermatitis or eczema. In the exemplification of the present invention examples of antisense oligonucleotides specific to nucleic acids encoding individual proteins in tables I to 82 are provided in SEQ ID NOS:11-223 (ADZ97857-ADZ98069).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Modulating, in a host cell, a protein-protein interaction between first protein, PRAK, (MAPKAPK5) and second protein, ERK3, (extracellular signal-regulated kinase 3) by administering modulating compound.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Bush A;

(MYRI-) MYRIAD GENETICS INC

WPI; 2005-371623/38.

Modulating, in a host cell, a protein-protein interaction between first protein, PRAK, (MAPKAPKS) and second protein, ERK3, (extracellular signal-regulated kinase 3) by administering modulating compound.

Disclosure; SEQ ID NO 155; 296pp; English.

The invention relates to a method for modulating, in a host cell, a protein interaction between a first protein which is PRAK (P38-c regulated/activated protein kinase or MAPRARS) and a second protein which is ERK3 (extracellular signal-regulated kinase 3). The method comprises administering to the cell a compound capable of modulating the protein-protein interaction. The method is useful in modulating in a host cell a protein-protein interaction between a first protein which is PRAK and a second protein which is ERK3 for treating inflammation or inflammatory disorders, e.g., aschma, rheumatorid arthritis, juvenile chronic arthritis, myositis, cloim's disease, gastritis, colitis, ulcerative colitis, inflammatory bowel disease, proteitis, pelvic conjunctivitis, scleritis, chronic inflammatory polyneuropathy, Tertiary lyme disease, psoriasis, dermatitis or eczema. In the exemplification of the present invention examples of antisense oligonucleotides specific to nucleic acids encoding individual proteins in tables 1 to 82 are provided in SEQ ID NOS:11-223 (ADZ97857-ADZ98069).

The invention relates to a method for modulating, in a host cell, a protein protein interaction between a first protein which is PRAK (P38-requlated/activated protein kinase or MAPRAPK5) and a second protein which is ERK3 (extracellular signal-regulated kinase 3). The method comprises administering to the cell a compound capable of modulating the protein-protein interaction. The method is useful in modulating in a host call a protein-protein interaction between a first protein which is PRAK and a second protein which is ERK3 for treating inflammation or inflammatory disorders, e.g., ashma, rheumatoid arthritis, juvenile chronic arthritis, myositis, Crohn's disease, gastritis, colitis, ulcerative colitis, inflammatory bowel disease, proctitis, pelvic inflammatory disease, systemic lugus erythematosus, rhinitis, conjunctivitis, scleritis, chronic inflammatory polyneuropathy, Tertiary Lyme disease, psoriasis, dermatitis or eczema. In the exemplification of the present invention examples of antisense oligonucleotides specific to nucleic acids encoding individual proteins in tables I to 82 are provided in SEQ ID NOS:11-223 (ADZ97857-ADZ98069).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Modulating, in a host cell, a protein-protein interaction between first protein, PRAK, (MAPKAPKS) and second protein, ERK3, (extracellular signal-regulated kinase 3) by administering modulating compound.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Bush A;
                                                                                                                                                                                                                                                                                                                                                                                            protein interaction; antisense oligonucleotide; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                14-MAR-2002
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Cimbora D,
                                                                                                                                                                                                               ADZ98000;
                                                                                           RESULT 633
```

```
The invention relates to a novel method for analyzing a nucleic acid. The method involves performing amplification and individual detection of a nucleic acid in a chip having several reaction layers for accommodating samples and reagents, to enable specific hybridization of the target nucleic acid and portions capable of controlling temperature conditions for amplification and detection of the nucleic acid. The invention further comprises a nucleic acid analyzer consisting of the chip as mentioned in the method, and a temperature control unit for performing hybridization for performing nucleic acid detection. The method enables convenient, cost-effective and highly accurate analysis of a nucleic acid acid. This sequence represents an oligo used in the nucleic acid analyzing method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Analyzing nucleic acid by performing amplification and individual detection of nucleic acid in chip having reaction layers for accommodating sample and reagent, and portions capable of controlling temperature conditions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps

This invention represents a novel cosmetic or pharmaceutical composition for treating epithelial covering tissue which comprises superstructure-forming nucleic acid sequences. The composition can also be used in fabric softeners, hand-washing products. Dody and hair care products, hair dyes or manual dishwashing products. The superstructures are G quadruplexes frayed wires or i motife. The sequences are 30.40 nucleotides long, have five or more C, G or I nucleotides in tandem, no CpG motifs, no nonmethylated CG dinucleotides, are poly1, polyC or polyG homopolymers and are optionally modified by replacing phosphodiester inkages with methylphosphonate, phosphoramidate, phosphorothicate or pertopyranoses or 3, 5, -canbocyclically bridged 2'-deoxyribose pertopyranoses or 3, 5, -canbocyclically bridged 2'-deoxyribose composition of the invention inhibits the release of IL-8. The composition is useful for preventing or treating inflammatory changes to epithelial covering tissue, including changes caused by pathogens, cutoimmune reactions, tumor necrosis factor, toxins and irritants, especially aging processes, psoriasis, atopic eczema, dry skin, alopecia areata, vitiligo, bullous diseases, rajection reactions, sunburn and parodontosis. This sequence represents a phosphorothicate or phosphodiester oligonucleotide used to illustrate the method of the
                                                                                                                                         dermatological disease; antiinflammatory; antiallergic; aging; eczema; alopecia; epidermolygis bullosa; graft rejection; periodontal disease; psoriasis; antipsoriatic; unburn; vitiligo; inflammation; detergent; dye; pigment; ss; primer; phosphorothioate; phosphodiester.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Cosmetic or pharmaceutical composition for treating epithelial tissue comprises superstructure-forming nucleic acid sequences.

Cosmetic or pharmaceutical composition for treating epithelial covering tissue comprises superstructure-forming nucleic acid sequences.

Disclosure; SEQ ID NO 1; 71pp; German.

This invention represents a novel cosmetic or pharmaceutical composition for treating epithelial covering tissue which comprises superstructureforming nucleic acid sequences. The composition can also be used in fabric softeners, hand-washing products, body and hair care products, hair dyes or manual dishwashing products. The superstructures are G quadruplexes, frayed wires or i motifs. The superstructures are G quadruplexes, frayed wire or mere C, G or I nucleocides in tandem, no composition, have five or mere C, G or I nucleocides in tandem, no CG motifs, no nonmethylated CG dinucleotides, are poly!, polyC or polyG nucleotides and are optionally modified by replacing phosphodisater inhages with methylphosphonate, phosphoramidate, phosphorothicate or hydroxylamine linkages, by replaced ribose with other hexo- or pentopyranoses or 3, 5, -carbocyclically bridged 2'-deoxyribose cervices or an expensive composition of the invention inhibits the release of IL-8. The composition is useful for preventing or treating inflammatory changes to epithelial covering tissue, including changes caused by pathogens, cuttoimmune reactions, tumor necrosis factor, toxins and irritants, especially aging processes, peoriasis, atopic eczema, dry skin, alogecia especially aging processes, psoriasis, atopic eczema, dry skin, alope areata, vitiligo, bullous diseases, rejection reactions, sunburn and parodontosis. This sequence represents a phosphorothioate or phosphodiester oligomucleotide used to illustrate the method of the invention.

The invention relates to a novel method for preparing an oligonucleotide with phosphorothioate internucleoside linkage(s), by phosphitylating the 5.-hydroxyl of a nucleic acid group to form a phosphite intermediate; and oxidizing the phosphite intermediate with a substituted acetyl disulfide or acetyl disulfide in an aprotic solvent with a protic solvent or a basic solvent enough to convert the phosphite intermediate to a phosphorothioate. The method is useful in molecular biological research and in applications such as anti-viral therapy. Modified oligonucleotides are also useful as antisense reagents because they can block ribonucleic acid translation, and are nuclease resistant. Phosphorothioate-containing oligonucleotides are also useful in determining the stereochemical pathways of certain enzymes that recognize nucleic acids. The sequences shown in (ABC31667-ABC31682) represent oligonucleotides of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Preparation of oligonucleotide with phosphorothioate internucleoside linkage(s) that determines stereochemical pathways of nucleic acid recognizing enzyme by, phosphitylating 5'-hydroxyl of nucleic acid and oxidizing phosphite intermediate.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      0.7%; Score 20; DB 1; Length 20;

The invention relates to a novel method for preparing an oligonucleotide with phosphorothioate internucleoside linkage(s), by phosphitylating the 5'-hydroxyl of a nucleic acid group to form a phosphite intermediate; and oxidizing the phosphite intermediate with a substituted acetyl disulfide or acetyl disulfide in an aprofic solvent with a protic solvent or a basic solvent enough to convert the phosphite intermediate to phosphorothioate. The method is useful in molecular biological research and in applications such as anti-viral therapy. Modified oligonucleotides are also useful as antisense reagents because they can block ribonucleic acid translation, and are nuclease resistant. Phosphorothioate-containing oligonucleotides are also useful in determining the stereochemical pathways of certain enzymes that recognize nucleic acids. The sequences shown in (AEC31667-AEC31682) represent oligonucleotides of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Preparation of oligonuclectide with phosphorothicate internucleoside linkage(s) that determines stereochemical pathways of nucleic acid recognizing enzyme by, phosphitylating 5'-hydroxyl of nucleic acid oxidizing phosphite intermediate.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gapa

ö

The invention relates to a novel reaction detection chip e.g. a DNA chip for diagnosis of disease. The novel chip has porous-glass particles that are embedded in organic film (e.g. vinyl acetate) as a monolayer on a substrate (e.g. silicon). The analyte is preferably detected by fluorescence. The invention further includes a process for the manufacturing of the detection chip. The detection chip is useful e.g. as a DNA chip for diagnosis of cancer, and albo for analysis of medical treatment of pathogenesis related gene of multifactorial disorder. This oligo sequence represents a control DNA probe used in the novel detection chip of the invention.

(EBAR ) EBARA CORP.

The present invention relates to a method (M1) for labeling double stranded nucleic acid for efficient detection of DNA or RNA. The method comprises using a carbodismide derivative for labeling one or more of thymine, uracil and guanine, which exists in the mismatch region of the double stranded nucleic acid or its vicinity, or unstable region of the hydrogen bond of the double stranded nucleic acid. (M1) is useful for labeling double stranded or single stranded nucleic acid or detecting single nucleotide polymorphisms. The present sequence was used to illustrate the method of the invention.

Example 1; Page 24; 40pp; Japanese.

The method comprises that a non-turbulent flow condition is formed for each solute molecule contained in a molecular solution separately, based on the thermodynamic characteristics of both molecules. The invention further describes a molecule separation device. The molecule separation method is useful for the manufacture of chemical substances, in required molecule from a molecular mixture effectively and rapidly. This oligo sequence represents a DNA probe used to test the novel molecule separation esparation method of the invention.
                                                                                                                                                                                                                                                                                                                                                                        Molecule separation for biotechnology, comprises forming a nonturbulent flow condition for each solute molecule based on thermodynamic characteristics and changing flow conditions at arbitrary points.

second protein, useful for treating or preventing, e.g. cancer, ischemia, stroke, autoimmune diseases, diabetes, coronary heart disease, or asthma. New isolated protein complex having a first protein interacting with a

Disclosure; SEQ ID NO 186; 198pp; English.

The invention relates to a novel isolated protein complex having a first protein interacting with a second protein. The invention further comprises: a protein microarray comprising the protein complex; a method for selecting modulators of the protein complex; a method of selecting modulators of an interaction between a first protein and a second protein; and the treating and/or preventing of diseases and disorders associated with the protein complexes. The protein complexes are useful in screening assays for identifying compounds effective in modulating the protein complexes, and in treating and/or preventing diseases and disorders associated with the protein complexes. The diseases and disorders include

The invention relates to a novel isolated protein complex having a first protein interacting with a second protein. The invention further comprises: a protein microarray comprising the protein complex; a method of compulses: a protein microarray complex; a method of selecting modulators of the protein complex; a method of selecting compulses of an interaction betweenting of diseases and disorders associated with the protein complexes. The protein complexes are useful in screening assays for identifying compounds effective in modulating the protein complexes, and in treating and/or preventing diseases and disorders complexes, and in treating and/or preventing diseases and disorders include cancer, adenomatous polyposis, ischemia, stroke, autoimmune diseases, diabetes, coronary heart disease, neurodegenerative diseases, asthma, cinflammatory disorders, sepsis, osteoporosis, obesity, viral infection, albo, glomerulonephritis, atherosclerosis, and muscular dystrophy. This sequence represents an antisease oligo of a human protein which forms
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to a novel isolated protein complex having a first protein interacting with a second protein. The invention further comprises: a protein microarray comprising the protein complex; a method for selecting modulators of the protein complex; a method of selecting modulators of an interaction between a first protein and a second protein; and the treating and/or preventing of diseases and disorders associated with the protein complexes. The protein complexes are useful in screening assays for identifying compounds effective in modulating the protein complexes, and in treating and/or preventing diseases and disorders associated with the protein complexes. The diseases and disorders include cancer, adenomatous polyposis, ischemia, stroke, autoimmune diseases, diabetes, coronary heart disease, neurodegenerative diseases, asthma, inflammatory disorders, sepsies, osteoporosis, obesity, viral infection, AIDS, glomerulonephritis, atherosclerosis, and muscular dystrophy. This sequence represents an antisense oligo of a human protein which forms
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New isolated protein complex having a first protein interacting with a second protein, useful for treating or preventing, e.g. cancer, ischemia, stroke, autoimmune diseases, diabetes, coronary heart disease, or asthma.

The present invention relates to a method for augmenting T-helper 1 cells administrating an immunostimulatory nucleic acid (1) to induce Thl-like immune activation in a subject. The method comprises immune activation, and administrating a cyclooxygenase inhibitor Illike inhibit prostaglandin expression, is new. The present sequence is one such immunostimulatory nucleic acid. (1) is useful for treating nonallergic inflammatory diseases such as psoriacis, inflammatory bowel diseases (Crohn's disease and ulcerative colitis), eczema, allergic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present invention provides a method for detecting the presence or absence of a single target molecule or target analyte (e.g. nucleic acid, protein, lipid, bacterium). The method involves contacting sample with
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Detecting target (e.g. nucleic acid, protein, lipid, bacterium) in sample, comprises contacting sample with one or more types of nanoparticle having target binding complements, and detecting any light scattering complex formed.
                                                     Use of an immunostimulatory nucleic acid and a cyclooxygenase inhibitor to augment T-helperl cells like immune activation and to treat non-allergic inflammatory diseases, e.g. psoriasis and Crohn's disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           T20 oligonucleotide used to prepare aptamer-coated gold probe arrays.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Garimella

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö
                                                                                                                                                                                                                                                                                                                                                      The present invention relates to a method for augmenting T-helper 1 cells (Th1)-like immune activation in a subject. The method comprises administrating an immunostimulatory nucleic acid (1) to induce Th1-like immune activation; and administrating a cyclooxygenase inhibitor (II) to inhibit prostaglandin expression, is new. The present sequence is one buch immunostimulatory nucleic acid. (I) is useful for treating non-allergic inflammatory diseases such as psoriasis, inflammatory bowel diseases (Crohn's disease and ulcerative colitis), eczema, allergic contact dermatitis or latex dermatitis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Immunostimulant, Antiinflammatory; Antipsoriatic; Gastrointestinal-Gen.; Antiulcer; Dermatological; Antiallergic; helper T-lymphocyte; immune stimulation; inflammation; psoriasis; inflammatory bowel disease; Crohns disease; ulcerative colitis; eczema; skin allergy;
                                                                                                                                                                                                                                                                   Use of an immunostimulatory nucleic acid and a cyclooxygenase inhibitor
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps
                                                                                                                                                                                                                                                                                  to augment T-helper1 cells like immune activation and to treat non-allergic inflammatory diseases, e.g. psoriasis and Crohn's disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö

one or more types of nanoparticle having target binding complements and detecting any light scattering complex formed. The nanoparticle probe complexes comprise two or more probes bound to a specific target analyte. The present sequence is an oligonucleotide used to prepare aptamer-coated gold probe arrays.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present invention provides a method for detecting the presence or absence of a single target molecule or target analyte (e.g. nucleic acid, protein, lipid, bacterium). The method involves contacting sample with one or more types of nanoparticle having target binding complements and detecting any light scattering complex formed. The nanoparticle probe complexes comprise two or more probes bound to a specific target analyte. The present sequence is a T20 diluent which is used in the preparation of aptamer-coated gold probes. Note: The present sequence is the SBQ ID NO: 26 which is given in the sequence listing. This sequence differs from the property of the specification (see
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Detecting target (e.g. nucleic acid, protein, lipid, bacterium) in sample, comprises contacting sample with one or more types of nanoparticle having target binding complements, and detecting any light

The method involves contacting sample with one or more types of nanoparticle having target binding complements and detecting any light scattering complex formed. The nanoparticle probe complexes comprise two or more probes bound to a specific target analyte. The present sequence is a deoxyadenosine spacer oligonucleotide which is useful for detecting analytes based on evanescent illumination of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Detecting target (e.g. nucleic acid, protein, lipid, bacterium) in sample, comprises contacting sample with one or more types of nanoparticle having target binding complements, and detecting any light

The invention relates to a purified antibody that is specifically immunoreactive with a stem cell factor (SCF) or SCF receptor. Also described: (1) a hybridoma cell line producing a monoclonal antibody that is specifically immunoreactive with a SCF protein; (2) inhibiting the activity of a mast cell population; (3) decreasing blood cell profleration or activity in a in a mammal; (4) decreasing the interaction between a SCF and an SCF receptor in a cell population; (5) treating a mammal having a disorder mediated through the interaction of SCF with an SCF receptor; and (6) a pharmaceutical composition of SCF with an SCF receptor; and (6) a pharmaceutical composition of SCF with an SCF receptor; and (6) a pharmaceutical composition of polypeptide, and a pharmaceutically immunoreactive with an SCF receptor in a cell population, decreasing the interaction maturation or activity in a in a mammal, decreasing the interaction between a SCF and an SCF receptor in a cell population, and treating a mammal having a clivity of maturation or activity in a in a mammal, decreasing the interaction between a SCF and an SCF receptor in a cell population, and treating a mammal having a clivity of maturation or activity composition, and methods are useful for treating disorders and the antibody, composition, and methods are useful for treating a universal cuberculosib, or malaria. The present sequence represents a universal oligonaclecide sequence which can be used as a probe or a PCR primer in the amplification and sequence mand and human SCF, which is used in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New stem cell factor antibody, useful for treating hematopoietic disorders such as anemia, leukemia, lymphoma, HIV, tuberculosis, or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Query Match

The present sequence is a negative control DNA probe used in the covalidation of the novel reactive detection biochip which is the subject of the invention. The present inventions relates to a novel reactive detection chip comprising spots formed by immobilizing several porous particles in a single-layers formed by immobilizing several porous particles in a single-layers formed by immobilizing several porous particles are transparent to incident light and have probe conscious bactuling molecules in a sample. In these chips, the number of probes and spot thickness can be stably controlled, and the three-confinements are stably increased, consequently improving the signal components in a spotter (which is claimed), hearting the substrate to substrate, applying the porous particles in a spotted arrangement on the confinement of immobilize the particles and removing excess of porous particles in the organic film (mapping the detection capacitics in chip manufacture confinement in maintains the dispersed state of porous particles without and any any additive to the spotting solution, and thus enabling the chip to be manufactured.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Reactive detection chip e.g. DNA chip to recognize functional molecule in genetic diagnosis, comprises spots formed by immobilizing porous particles including probes, in single-layered state on substrate, with particles transparent to light.
                                                                                                                                                                                                                                                                                        ss; biochip; p53 gene; tumor suppressor gene p53; DNA detection; probe.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                  /note= "conjugated porous glass particle"

human or other subject. (M1) comprises: (a) obtaining hematopoiesis in a human or other subject. (M1) comprises: (a) obtaining hematopoietic brogenitor cells from the human or other subject; (b) expanding the cells obtained in step (a) by adding to the cell a stem cell factor (SCF) collypeptide having a 195, 208 or 245 amino acid sequence of AEB60706, AEB60708 or AEB60725, or its biological active fragments that stimulate growth of hematopoietic progenitor cells; and (c) administering to the human or other subject the expanded hematopoietic progenitor cells; obtained in step (b), therefore restoring hematopoiesis to effect hematopoiesis in the human or other subject. Also described is a method comprises; (M2) for expanding hematopoietic progenitor cells ex vivo, which comprises; (a) obtaining hematopoietic progenitor cells ex vivo, which comprises; (a) obtained in step (a) by adding to the cells the comprises; (a) obtained in step (b) aspanding the cells obtained in step (a) by adding to the cells the chancing hematopoietic progenitor cells, where the hematopoietic cells are chosen from stem cells, lymphoid progenitor cells, myeloif progenitor expanding hematopoietic progenitor cells, where the hematopoietic cells, are chosen from stem cells, lymphoid progenitor cells, myeloif progenitor cells, magakarycoytes and erythroblasts. (M1) is useful for treating various stem cell deficiencies such as aplastic anemia, parcoxymal nocturnal hemaglobinuria, myeloifbrosis, myelosclerosis, Gaucher's disease, Niemann-Pick disease, Hodgkin's disease, Kala-azar, sarcoidosis,

The invention relates to an aptamer probe (I) comprising an aptamer having an obligonucleotide tail, and a second oligonucleotide having a gequence complementary to at least a portion of a sequence of the oligonucleotide tail comprising an optional label. Also described: (I) detecting (MI) at least one target analyte having at least two binding stites, in a sample; (2) a nanoparticle-aptamer conjugate probe (II) comprising annoparticles, and at least one type of aptamers being present or net nanoparticle at a surface density ranging from between about 1.0x10 10 and about 5.0x10 12 aptamers/cm2; (3) a substrate, at least one type of capture aptamers bound to the substrate, where each type of detecting one or more target analytes comprising a substrate, at least one type of capture aptamers bound to the substrate and arranged in an array of discrete spots, and electrodes located between the discrete spots; and (4) a kit (KI) for detecting one or more analytes in a sample comprising (I) or (III) and an optional substrate. (I) is useful for detecting at least one target analyte in a sample. The method is useful
                                                                                                                                                                                                                                                                  ö
disseminated fungus disease, fulminating septicemia, malaria, vitamin B12, and folic acid deficiency, pyridoxine deficiency, Diamond blackfan anemia, hypopigmentation disorders such as piebaldism and vitiligo, and AIDS. (M2) is useful in expanding early hematopoietic progenitors in syngeneic, allogeneic or autologous bone marrow transplantation. (M1) enhances hematopoiesis by expanding early hematopoietic progenitors. The present sequence represents a universal PCR primer for SCF, which is used
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Novel aptamer probe comprising aptamer having oligonucleotide tail, and oligonucleotide having sequence complementary to portion of sequence of oligonucleotide tail having optional label, useful for detecting target

The invention relates to an aptamer probe (I) comprising an aptamer having an oligonucleotide tail, and a second oligonucleotide having a sequence complementary to at least a portion of a sequence of the coligonucleotide tail comprising an optional label. Also described: (I) detecting (MI) at least one target analyte having at least two binding of sites, in a sample; (2) a nanoparticle-aptamer conjugate probe (II) comprising nanoparticles, and at least one type of aptamers being present on the nanoparticle at a surface density ranging from between about on the nanoparticle at a surface density ranging from between about on the nanoparticle at analytes comprising a substrate, at least one type of capture aptamers bound to the substrate, where each type of capture aptamers bound to the substrate, where each type of capture aptamers bonds to the specific target analytes and arranged in an array of discrete spots, and electrodes located between the discrete spots; and (4) a kit (KI) for detecting one or more analytes in a sample of comprising (I) or (II) and an optional substrate. (I) is useful for detecting one or more target analyte in a sample. The with or comprising at least one target analyte in a sample. The kit or substrate are useful in
    is useful in
substrate are useful for detecting one or more analytes. (I) is useful ir barcode detection assays and in therapeutic, diagnostic and target validation applications. (I) can be readily synthesized, manipulated and stored for long periods of time. (I) provides reproducibility in production. The present sequence represents a synthetic poly-T20 oligonucleotide, which is used in the exemplification of the present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Novel aptamer probe comprising aptamer having oligonucleotide tail, and oligonucleotide having sequence complementary to portion of sequence of oligonucleotide tail having optional label, useful for detecting target

The method and coupling agent of the invention are useful for preparing an internucleotide phosphorothicate linkage enriched in the Rp or Sp enantiomer between a synthon having a hydroxyl moiety at the 5' position and a 2'-substituted nucleoside having an activated phosphate moiety at the 3'-position. The present sequence is an antisense
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Rр

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Analysis of cDNA and gene expression - by amplification of mRNA followed
                                                                                                                                                                                                                                                                                                                                                                                                                                   A method for the analysis of cDNA comprises (a) preparing an aggregate of double-stranded cDNAs by using an aggregate of mRNAs and a plural type of labelled reverse transcription primers (GENESEQ files AAQ75547-075798) and using the aggregate of mRNAs as the template for each reverse transcription primer; (b) digesting each of the prepared aggregates of the double-stranded cDNAs with restriction enzyme and; (c) electrophoresing the digested aggregate of cDNAs in seperate lanes. The method can be used to analyse gene expression rapidly and easily

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             A method for the analysis of cDNA comprises (a) preparing an aggregate of double-stranded cDNAs by using an aggregate of mRNAs and a plural type of abelled reverses transcription primers (GENESEQ files AAQ75547-075798) and using the aggregate of mRNAs as the template for each reverse transcription primer; (b) digesting each of the prepared aggregates of the double-stranded cDNAs with restriction enzyme and; (c) electrophoresing the digested aggregate of cDNAs in seperate lanes. The method can be used to analyse gene expression rapidly and easily

The sequences represented by, AAQ90390-90401 are synthetic DNA probes containing 3' ribonucleoside termini. The sequences shown in AAQ90402-15 are synthetic DNA probes with 5' amino termini. These sequences were specific for the polymorphisms of HLA gene dQa. The sequences were in the device of the invention. This is a self-addressable electronic device (SAED) that can be used to carry out multi-step and multiplex reactions, such as nucleic acid hybridisations. The advantages of this method are that these reactions can be carried out with complete and precise electronic control, and that the rate, specificity and sensitivity of these reactions are greatly improved at micro-locations
                                               A method for the analysis of cDNA comprises (a) preparing an aggregate of double-stranded cDNAs by using an aggregate of mRNAs and a plural type of ababiled reverse transcription primers (GENESEQ files AAQ75547-Q75798) and using the aggregate of mRNAs as the template for each reverse transcription primer; (b) digesting each of the prepared aggregates of the double-stranded CDNAs with restriction enzyme and; (c) electrophoresing the digested aggregate of cDNAs in seperate lanes. The method can be used to analyse gene expression rapidly and easily
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New self-addressable electronic devices - used for multi-step and multiplex reactions such as DNA hybridisation(s), clinical diagnostics and bio:polymer synthesis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      CP-1; HLA; dQa; 3' ribonucleoside; self-addressable electronic device; SAED; hybridisation; ss.

The sequences given in AAT10742-67 are synthetic oligonucleotides which are used in the construction of the electronically self-addressable device (BD) of the invention. The BC comprises a substrate, an electrode or opt. a number of electrode supported by the substrate, a current source operatively connected to the electrode and an attachment layer adjacent to the electrode which is permeable to a counterion but not permeable to a molecule capable of insulating or binding to the electrode. The attachment layer is capable of attaching a macromolecule. The ED is used for genetic typing and comprises a number of electrodically, such as one of these probes, attached to each of the locations capable of a genetic sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Electronically self-addressable device - used for electronic control of, e.g. nucleic acid hybridisation.

New microelectronic device designed to carry out and control multi-step and multiplex molecular biological reactions in microscopic format.

Example 1; Page 89; 179pp; English.

The specification describes a self-addressable, self-assembling microelectronic device which is designed to actively carry out and control multi-step and multiplex molecular biological reactions in microscopic formats. A key aspect of this inventions is played by the ion permeable permeation layer which overlies the electrode. This permeation layer which overlies the electrode. This permeation layer which overlies the electrode. This permeation layer separates the attached oligonucleotides and hybridization but also separates the attached oligonucleotides and hybridize drarget DNA sequences from the highly reactive electrochemical environment generated immediately at the electrode surface. The microelectronic device is designed and fabricated to activaly carry out and control reactions such as nucleic acid hybridizations, antibody/antigen reactions, sample preparation, diagnostics and biopolymer synthesis. The device can electronically control the transport and attachment of specific binding electronically so nucleic acids and polypeptides, to specific microlocations. The device can subsequently control the transport and reactions of the analytes or reactants at the addressed specific microlocations. The present sequence represents a probe used to exemplify the invention hybridization reactions and improve the detection of analytes. The device is able to concentrate analytes and reactants, remove non-specifically bound molecules, provide stringency control for DNA

This interior describes a novel method for sorting single-stranded concluded acids by isolation and hybridisation of nucleic acids pools, then reading out, where the nucleic acids are selectively bound using capture cadening out, where the nucleic acids are selectively bound using capture cadening out, where the nucleic acids are selectively bound using capture cadening out, where the nucleic acids are surface of a solid matrix and (b) comprise variable anchor region, the complement of which is present at least nucleic acid and a 3' variable, discriminatory region that comprises all possible combinations of up to 10 nuclectides to allow binding of particularly locked nucleic acids (LMA) and the anchor region comprises a sequence of 10-50, particularly 15-25, T residues. The capture oligonucleotides are biotinylated and immobilised on a surface by interaction with streptavidin. The matrix is of plastic, ceramic, glass, metal, resin, gel, crystalline material and/or membrane, having semiconducting properties and especially in the form of a chip. Its surface is particularly a layer of (bio) molecular filaments and binding of single stranded nucleic acids to the surface is (quasi) conducting to the surface is (quasi) conducting to the surface acid in for analysis of patterns, especially in mucosal, conducting to a carboxylic or fatty acid) or through a molecular, conductives or supplements, especially minerals, trace elements, organic acids in a callows inaging of the complete pattern of all nucleic acids from cells, and conjucte pattern of all nucleic acid pool. Since the mathod is based on comparison of nucleic acid pools of the invarious nucleic acid in the mathod is passible. AbkOl1344 represent converse and in the nucleic acid pools. This invention describes a novel method for sorting single-stranded capture probes used in the method of the invention.

Sorting single-stranded nucleic acid, useful for analyzing expression patterns and screening active agents, uses capture agent with variable WPI; 2003-714082/68

Example; Page 4; 8pp; German.

and constant regions

Example; Page 5; 8pp; German.

This invention describes a novel method for sorting single-stranded nucleic acids by isolation and hybridisation of nucleic acid pools, then reading out, where the nucleic acids are selectively bound using capture agents that are (a) immobilised on the surface of a solid matrix and (b) comprise variable and non-variable regions. The capture oligonucleotides have a 5'-invariable and non-variable regions. The capture oligonucleotides comprises all possible combinations of up to 10 nucleotides to allow binding of particularly locked nucleic acids. The capture of particularly locked nucleic acids (INA) and the anchor region comprises are particularly locked nucleic acids (INA) and the anchor region comprises a sequence of 10-50, particularly 15-25, T residues. The capture oligonucleotides are biotinylated and immobilised on a surface by interaction with streaptavidin. The metrial and/or membrane, having semiconducting properties and especially in the form of a chip. Its surface is particularly a layer of (bio)molecular filaments and binding of single stranded nucleic acids to the surface is (quasi) covalent, supramolecular physical, stimulated by an electrical field or through a molecular sieve. The method is used (i) for analysis of patterns, especially in mucosal, callines or supplements, especially minerals, trace elements, organic called sandour nutritional compounds, e.g. food activity of pharmaccuticals and/or nutritional compounds, e.g. food activity of pharmaccuticals and/or nutritional compounds, e.g. food activity of analysis of patterns, especially minerals, trace elements, organic callows inaging of the complete pattern of all nucleic acid so and electricate and electricate and electricate and activity of analysis of the complete pattern of all nucleic acid so and electricate and electricate and acid pools of nucleic acid pool. Since the captes matrix minaturisation is possible, how acid pools in a particular pattern of allows matrix minaturisation is possible, how acid pools and particular pattern of t capture probes used in the method of the invention.

This invention describes a novel method for sorting single-stranded nucleic acids by isolation and hybridisation of nucleic acid pools, then reading out, where the nucleic acids are selectively bound using capture reading out, where the nucleic acids are selectively bound using and (b) agents that are (a) immobilised on the surface of a solid matrix and (b) comprise variable and non-variable regions. The capture oligonucleotides have a 5'-invariable anchor region, the complement of which is present at that comprises all possible combinations of up to 10 nucleotides to allow binding of particular sorts of single stranded nucleic acids. The capture of agents are particularly locked nucleic acids (LMA) and the anchor region comprises are particularly locked nucleic acids (LMA) and the anchor region comprises a sequence of 10-50, particularly 15-25, T residues. The capture oligonucleotides are biotinylated and immobilised on a surface interaction with streptavidin. The metrial and/or membrane, having semiconducting properties and especially in the form of a chip. Its surface is particularly a layer of (b) molecular filaments and binding of shingle conducting propertical field or through a molecular situated by an electrical field or through a molecular of physical, stimulated by an electrical field or through a molecular conducting propertical sud/or nutritional compounds, e.g. food activity of pharmaccuticals and/or nutritional compounds, e.g. food activity of pharmaccuticals and/or nutritional compounds, e.g. food activity of analysis of patterns, specially minerals, trace elements, organic caids indino, carboxylic or fatty acid) or their derivatives, salts and contrast maining of the complete pattern of all nucleic acid singing of the complete pattern of all nucleic acid sold in a cell, and can lows imaging of the complete pattern of all nucleic acid sold on the nucleic acid pools, not individual can detect very small differences in the nucleic acid pools, not individual can detect very small of the method is ba

This invention describes a novel method for sorting single-stranded nucleic acids by isolation and hybridisation of nucleic acid pools, then creading out, where the nucleic acids are selectively bound using capture agents that are (a) immobilised on the surface of a solid matrix and (b) comprise variable and non-variable regions. The capture oligonucleotides of compariable anchor region, the complement of which is present at least once in each nucleic acid and a 3'-variable, discriminatory region that comprises all possible combinations of up to 10 nucleotides to allow comprises a sequence of single stranded nucleic acids. The capture comparises a sequence of 10-50, particularly 15-25, T residues. The capture oligonucleotides are biotinylated and immobilised on a surface by interaction with streptaviain The matrix is of plastic, ceramic, glass, capture oligonucleotides are biotinylated and immobilised on a surface conducting properties and especially in the form of a chip. Its surface conducting properties and especially in the form of a chip. Its surface is particularly a layer of (bio)molecular filaments and binding of single stranded nucleic acids to the surface is (quasi) covalent, supramolecular sieve. The method is used (i) for analysis of patterns, especially in mucosal, attinity of pharmaceuticals and/or nutritional compounds, e.g. food
                                                                                                                                                                                                               ö

allows imaging of the complete pattern of all nucleic acid in a cell, a can detect very small differences in the nucleic acid pool. Since the method is based on comparison of nucleic acid pools, not individual genes, matrix miniaturisation is possible. ADK01281-ADK01344 represent capture probes used in the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Sorting single-stranded nucleic acid, useful for analyzing expression patterns and screening active agents, uses capture agent with variable and constant regions.
                                                                                                                                                                                                                 Gaps

Sorting single-stranded nucleic acid, useful for analyzing expression patterns and screening active agents, uses capture agent with variable and constant regions. Example; Page 5; 8pp; German.

This invention describes a novel method for sorting single-stranded nucleic acids by isolation and hybridisation of nucleic acids pools, then reading out, where the nucleic acids are selectively bound using capture capture the nucleic acids are selectively bound using capture is membhilised on the surface of a solid marrix and (b) comprise variable anchor region. The capture oligonucleotides that capture as 5'-invariable anchor region, the complement of which is present at least once in each nucleic acid and a3'-variable, discriminatory region that comprises all possible combinations of up to 10 nucleotides to allow binding of particular sorts of single stranded nucleic acids. The capture agents are particularly locked nucleic acids (LMA) and the anchor region comprises a sequence of 10-50, particularly 15-25, T residues. The capture oligonucleotides are biotinylated and immobilised on a surface by interaction with streptavidin. The matrix is of plastic, ceramic, glass, metal, resin, gel, crystalline material and/or membrane, having semiconducting properties and especially in the form of a chip. Its surface is particularly a layer of (bio)molecular filaments and binding of single stranded nucleic acids to the surface is (quasi)covalent, supramolecular,

physical, stimulated by an electrical field or through a molecular sieve The method is used (i) for analysis of patterns, especially in mucosal, hair root, blood, nerve or germ cells and (ii) for determining the activity of pharmaceuticals and/or nutritional compounds, e.g. food additives or supplements, especially minerals, trace elements, organic acids (amino, carboxylic or fatty acid) or their derivatives, salts and mixtures. The method provides rapid, inexpensive and reproducible representation of differences in pools of nucleic acids from cells. It allows imaging of the complete pattern of all nucleic acid in a cell, an can detect very small differences in the nucleic acid pool. Since the method is based on comparison of nucleic acid pools, not individual genes, matrix miniaturisation is possible. ADK01281-ADK01344 represent capture probes used in the method of the invention.

Sorting single-stranded nucleic acid, useful for analyzing expression patterns and screening active agents, uses capture agent with variable and constant regions.

Example; Page 5; 8pp; German.

This invention describes a novel method for sorting single-stranded nucleic acids by isolation and hybridisation of nucleic acid pools, then reading out, where the nucleic acids are selectively bound using capture agents that are (a) immobilised on the surface of a solid matrix and (b) comprise variable and non-variable regions. The capture oligonucleotides have a 5'-invariable anchor region, the complement of which is present at least once in each nucleic acid and a 3'-variable, discriminatory region that comprises all possible combinations of up to 10 nucleotides to allow binding of particulary locked nucleic acids (LMA) and the anchor region comprises a sequence of 10-50, particularly 15-25, T residues. The capture oligonucleotides are biotinylated and immobilised on a surface by interaction with streptavidin. The matrix is of plastic, ceramic, glass,

metal, resin, gel, crystalline material and/or membrane, having semiconducting properties and especially in the form of a chip. Its surface is particularly a layer of (bio)molecular filaments and binding of single stranded nucleic acids to the surface is (quasi)covalent, supramolecular, physical, stimulated by an electrical field or through a molecular, the method is used (i) for analysis of patterns, especially in mucosal, hair root, blood, nerve or germ cells and (ii) for determining the activity of pharmaceuticals and/or nutritional compounds, e.g. food additives or supplements, especially minerals, trace elements, organic acids (amino, carboxylic or fatty acid) or their derivatives, salts and mixtures. The method provides rapid, inexpensive and reproducible representation of differences in pools of nucleic acid from cells. It can detect very small differences in the nucleic acid pool. Since the method is based on comparison of nucleic acid pools, not individual genes, matrix miniaturiation is possible, ADK01281-ADK01344 represent capture probes used in the method of the invention.

Sorting single-stranded nucleic acid, useful for analyzing expression patterns and screening active agents, uses capture agent with variable and constant regions.

Example; Page 6; 8pp; German.

This invention describes a novel method for sorting single-stranded nucleic acids by isolation and hybridisation of nucleic acid pools, then reading out, where the nucleic acids are selectively bound using capture agents that are (a) immobilised on the surface of a solid matrix and (b) comprise variable and non-variable regions. The capture oligonucleotides have a 5' invariable anchor region, the complement of which is present at least once in each nucleic acid and a 3'-variable, discriminatory region that comprises all possible combinations of up to 10 nucleotides to allow binding of particular sorts of single stranded nucleic acids. The capture

comprises a sequence of 10-50, particularly 15-25, T residues. The capture oligonuclectides are biotinylated and immobilised on a surface by interaction with streptavidin. The matrix is of plastic, ceramic, glass, metal, resin gel, crystalline material and/or membrane, having semiconducting properties and especially in the form of a chip. Its surface is particularly a layer of (bio)molecular filaments and binding of single stranded nucleic acids to the surface is (quasi)covalent, supramolecular, physical, stimulated by an electrical filed or through a molecular sieve. The method is used (i) for analysis of patterns, especially in mucosal, hair root, blood, nerve or germ cells and (ii) for determining the cerivity of pharmaceuticals and/or nutritional compounds, e.g. food additives or supplements, especially minerals, trace elements, organic acids (amino, carboxylic or fatty acid) or their derivatives, salts and mixtures. The method provides rapid, inexpensive and reproducible crepresentation of differences in pools of nucleic acids from cells. It allows imaging of the complete pattern of all nucleic acid in a cell, and can detect very small differences in the nucleic acid in a cell, and method is based on comparison of mucleic acid pool. Since the method is based on comparison of nucleic acid pools individual capture probes used in the method of the invention.

Pharmaceutical composition for treating asthma, has antisense oligonucleotide containing less percentage of adenosine, targeted to nucleic acids associated with lung airway or lung dysfunction, and bronchodilating agent.

```
The invention describes a nover composition, alleviating active agent, comportating adenosine (effective for alleviating bronchoconstriction, respiratory tract inflammation, allergies and reducing adenosine sensitivity, levels of adenosine (A) or (A) receptors, curfactant depletion or hyposecretion, when administered to a mammal. The oligonucleotides are derived from a gene encoding or regulating or conference in apparate containers, (b) the oligonucleotides, (c) device, in separate containers, (b) the oligonucleotides, (c) device, in separate containers, (b) the oligonucleotides, (c) instructions for adding a carrier and for use of the kit. The composition of the invention has antiallergic, antiinflammatory, antiasthmatic, of the invention has antiallergic, antiinflammatory, antiasthmatic, analgesic, hypotensive, immunosuppressive and cycostatic activity, is a certain a respiratory, lung or malignant disease. The administered composition comprises oligo and is administered to reduce the production or availability, or to increase the degradation of the target mRNA or to reduce the amount of target polypeptide present in the lungs. The composition, and/or bronchoconstriction and/or lung cinflammation, allergies and/or surfactant hypoproduction are associated with a disease or condition such as pulmonary vasoconstriction, allergies and/or surfactant hypoproduction are associated inflammation, allergies, asthma, impeded respiration; respiratory cy distress syndrome, pain, cystic fibrosis, allergic thinitis, pulmonary charteress syndrome, pain, cystic fibrosis, allergic thinitis, pulmonary cor thymidines present in the target RNA serves to prevent the bystem or the oligonucleotides into products that free adenosine content of the anti-sense oligos corresponding to the oligonucleotides into products that free adenosine to prevent the system of the oligonucleotides into products that free adenosine content of the oligonucleotides into products that free adenosine or prevent and the present in the reduce the productio
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Human; antisense; bronchoconstriction; allergy; hyposecretion; pain; respiratory tract inflammation; adenosine sensitivity; lung; cancer; surfactant depletion; antiallergic; antiinflammatory; antiasthmatic; analgesic; hypotensive; immunosuppressive; cytostatic; cystic fibrosis; beta-adrenergic agonist; respiratory disease; pulmonary vasoconstriction; respiratory distresses syndrome; allergic rhinitis; pulmonary hypertension; emphysema; chronic obstructive pulmonary disease; cancer; bronchitis; pulmonary transplantation rejection; ss; primer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   e.g., lung, brain, heart, kidney, etc, tissue environment and thereby, to prevent any unwanted effects due to it
                                                                          This invention describes a novel composition (a) a first active agent,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Sequence 21 BP; 20 A; 0 C; 0 G; 0 T; 0 U; 1 Other;

Thus invention describes a novel composition, a latter active agent, comparising oligonucleotides, effective for alleviating bronchoconstriction, respiratory tract inflammation, allergies and bronchoconstriction, respiratory tract inflammation, allergies and content adequate associated with lung airway or lung expression of a target polypeptide associated with lung airway or lung dysfunction or cancer and can be anti-sense to the corresponding mRNA. The invention also describes a kit, that comprises: (a) a delivery device, in separate containers, (b) the oligonucleotides, (c) instructions for adding a carrier and for use of the kit. The composition of the invention has antiallergic, antiinflammatory, antiasthmatic, analgesic, hypotensive, immunosuppressive and cytostatic activity, is a beta-adrenergic agonist. The composition is useful for preventing or treating a respiratory, lung or mallignant disease. The administered composition comprises oligo and is administered to reduce the production or availability, or to increase the degradation of the target mRNA or to reduce the amount of target polypeptide present in the lungs. The pulmonary obstruction, and/or bronchoconstriction and/or lung area ö inflammation, allergies and/or surfactant hypoproduction are associated with a disease or condition such as pulmonary vasoconstriction, inflammation, allergies, asthma, impeded respiration, respiratory distress syndrome, pain, cystic fibrosis, allergic rhinitis, pulmonary transplantation, emphysema, chronic obstructive pulmonary disease, pulmonary transplantation rejection, pulmonary infections, bronchitis or cancer. The reduced adenosine content of the anti-sense oligos corresponding to thymidines present in the target RNA serves to prevent the breakdown of the oligonucleotides into products that free adenosine into the system e.g., lung, brain, heart, kidney, etc, tissue environment and thereby, to invention describes a novel composition (a) a first active agent Gape Pharmaceutical composition for treating asthma, has antisense oligonuclectide containing less percentage of adenosine, targeted trucleic acids associated with lung airway or lung dysfunction, and ä ö Aguilar 0.7%; Score 20; DB 1; Length 21; 15.2%; Pred.                                                                                                                                                                                                  ö
                                                                                                                                      The intercalator of the invention may be useful for the electrochemical detection of a gene, as an electrochemical double stranded DNA detection reagent and as an intercalator for inhibiting the influence of mismatch DNA and single stranded DNA. The intercalator enables the transmission of electronic transition between two base pairs to occur efficiently. The current sequence is that of the electrochemical detection intercalator related DNA 1 of the invention.
                                                                                                                              The invention relates to a novel intercalator having a specific formula.
                                                                                                                                                                                                                                         Gaps
                                                                                      Novel intercalator, useful as electrochemical double stranded DNA
                                                                                                                                                                                                                                         ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Novel fluorescently labeled nucleoside triphosphate, useful for

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Achiral linker reagents have been developed for the incorporation of multiple amino groups into oligonucleotides. The present sequence represents a modified oligodeoxyribonucleotide. The achiral linker reagents can be used for incorporation of multiple primary amino groups
                                                                                   The present invention relates to fluorescently labeled nucleoside triphosphate. The invention is useful for determining nucleic acid sequence of target nucleic acid. The present sequence is a RNA used in sequencing nucleic acids.
                                                                                                                                                                                                                                                                                            Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      88.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        5- (aminomethyl) -1,3-benzenedimethanol"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         5-(aminomethyl)-1,3-benzenedimethanol"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Amino modified oligodeoxyribonucleotide; oligonucleotide; achiral linker reagent; 5-(aminomethyl)-1,3-benzenedimethanol; N-fluresceinyl-(5-aminomethyl)-1,3-benzenedimethanol; hybridisation probe; PCR primer; nucleic acid sequencing; affinity matrix; cloning recombinant DNA; in-vitro mutagenesis;

or reporter groups into oligonucleotides. They are compatible with conventional DNA synthesis following the phosphoramidite methodology, and can be incorporated in good yields. The linker reagents may be used for labelling of oligonucleotides. They may also be used for preparation of oligonucleotides. They may also be used for preparation of primers in the polymerase chain reaction or in nucleic acid sequencing reactions, for production of affinity matrices for purification of DNA binding proceins or other biomolecules, for production of affinity matrices for detection of nucleic acid sequences, for cloning recombinant

Dombkowski AA, Nagel AC; Kane MD,

(GENO-) GENOMIC SOLUTIONS INC.

WPI; 2002-508123/54.

Identifying and characterizing gene expression in samples, for identifying mRNAs expressed at different levels, comprises employing an identimer having a oligo-dT primer of a specific sequence and a detectable marker at its 5' end.

Example 1; Page 15; 45pp; English.

of gene expression in one or more samples, comprising an identification of gene expression in one or more samples, comprising an identification of proceed as a specific oligo-dT primer sequence, where the identifier a variety of detectable marker at its 5' end. The system is useful for identifying any or all genes expressed in a given in vivo or in vitro RNA sample, as well as the relative differences in mRNA between 2 or more samples, where that are expressed at different levels between 2 or more samples. The new system or method addresses limitations of prior methods by comprising compositions and systems that incorporate new strategies where molecular or biochemical assay compositions and systems are linked to DNA or RNA capturession. The system has the following advantages over existing expression. The system has the following advantages over existing nethods: (a) prior sequence information or clone library construction is not needed to enable the assay; (b) provides immediate sequence inferences information concerning changes or differences The invention relates to systems for identification and characterisation

```
ö
in mRNA level, to determine mRNA expression level and mRNA identification in one assay; (c) generates cDNA fragments from all mRNAs present in the sample for subsequent investigation by common molecular biology techniques; and (d) does not require prior knowledge of the sequence of the genome of the organism under investigation and can be employed in organisms lacking significant genomic sequence in formation. The present sequence represents an oligo dT primer used in the method of the

New immunostimulatory oligonucleotide comprising non-palindromic nucleic acid sequence motif, useful for inducing B-cell activation, treating, preventing or ameliorating immune system disorder or tumoral disease e.g. melanoma

Disclosure, Fig 3; 139pp; English.

This invention relates to novel immunostimulatory oligonucleotides that contain a non-palindromic sequence motif. Specifically, it refers to DNA oligonucleotides (without a cpG motif), which can atimulate an immune response in animals of the order of primate, including humans. The immune and antibody production in B-cells, as well as cell differentiation, cytokine and antibody production in B-cells, as well as cells. The present invention describes immunomodulator compositions that also comprise an antigen selected from, for example, viruses, bacteria, parasites, tumour cells and glycolipids. As such, these DNA oligos can be used in gene therapy for inducing B-cell activation, treating, preventing or ameliorating an immune system disorder or a tumoural disease including chronic myelogenous leukaemia, melanoma, Kaposi's sarcoma, and renal cell carcinoma. This oligonucleotide sequence is an immunostimulatory non-CpG

Dominant negative alleles of human mismatch repair genes can be used to generate hypermutable cells and organisms. They increase the rate of spontaneous mutations by reducing the effectiveness of DNA repair and thereby render the cells or animals hypermutable. The method is used to produce genetically altered organisms to produce new output traits. The prosent sequence is a bacterial poly purine nucleotide phosphorylase (polyPNP) DNA fragment containing an in-frame polyA tract. This sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Generating mutation in gene using cells which contain defective mismatch repair gene, useful to generate genetically altered mutations with new output traits.
                                                                                                                                                                                                                                                                                                                           Hypermutable organism; dominant negative allele; mismatch repair gene; spontaneous mutation; DNA repair; purine nucleotide phosphorylase; PNP;

The invention relates to a method of determining a functional property of a fluid in a chamber comprising introducing into the chamber a support to which is bound several test elements each of the test elements comprising a reaction domain and a detection domain, introducing into the chamber a fluid that is interactive with the reaction domains, removing the fluid from the chamber, determining by means of the detection domains the fluid as not interacted with the reaction domains the locations at which the fluid has not interacted with the reaction domains comprises a member of a specific binding pair. The determining of the step involves treating the test elements to modify only those reaction comprises a member of a specific binding pair. The determining of the step involves treating the test elements to modify only those reaction comprises that have interacted with the fluid. The fluid in the method is chosen from the flow pattern of the fluid. The fluid in a chamber and the method provides for the characterisation of a fluid in a known fluid in a new flow cell or a new fluid in a known flow the invention. This sequence represents a test element used in the method of the invention.

The invention relates to an oligonucleotide having the formula: (a) 5'

XYMIYZN2 3' where 5' denotes the 5' end of the oligonucleotide and 3'
denotes the 3' end of the oligonucleotide, x is a T or modified T
cucleotide, y is a C or modified C nucleotide, z is a G or modified G
nucleotide, and N1 and N2 are polymucleotides that do not include a CG
dinucleotide, where N1 does not include 5' Z nucleotide, and where a 3'
concleotide consisting of the YZ dinucleotide and the N2
polymucleotide consisting of the YZ dinucleotide and the N2
polymucleotide contains a number of nucleotides that is at most 45% of
the number of nucleotides in the oligonucleotide, and (b) 5' XYNIYZNZ 3'
where 5' denotes the 5' end of the oligonucleotide, and (b) 5' XYNIYZNZ 3'
where 5' denotes the 5' end of the oligonucleotide, and (b) 5' XYNIYZNZ 3'
c not of the oligonucleotide, where X is a T or modified T nucleotide, N is a
c or modified c nucleotide, where N1 does not include a CG
dinucleotide of 5 to 3 nucleotides. Also described are: (1) a
polymucleotide of 5 to 3 nucleotides. Also described are: (1) a
polymucleotide of 5 to 3 nucleotides. Also described are: (1)
a polymucleotide of 5 to 3 nucleotides. Also described are: (1)
c apparentic agents, monoclonal antibodies, and anticancer agents,
radiotherapeutic agents, monoclonal antibodies, and anticancer agents,
c netto of interferon (IFN)-alpha expression relative to IFN-alpha
administering an oligonucleotide or a pharmaceutical composition to the
subject in need of increased IL-10 expression relative to IFN-alpha
cyll response in a subject exposed to an antigen; (4) a method of
inducing an antigen-specific regulatory B cell response in a subject by
                                                    ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New oligonucleotides, useful for treating an allergy or asthma, or an autoimmune disease, arthritis, systemic lupus erythematosus, multiple sclerosis, Crohn's disease, or Type 1 diabetes mellitus.

administering an immunostimulatory nucleic acid or composition to a subject exposed to an antigen; (5) a method of treating an allergy or aethma by exposing a subject to an allergen, and administering an immunostimulatory nucleic acid or composition to the subject, where the immunostimulatory nucleic acid or composition is administered in an amount sufficient to prevent or allergiate an allergen, and administering an immunostimulatory nucleic acid or composition to the subject, where the immunostimulatory nucleic acid or composition to the subject, where the immunostimulatory nucleic acid or composition is administered in an amount sufficient to prevent or treat an autoimmune disease in the subject, and (7) a method of reducing an antigen-specific response to an immunostimulatory nucleic acid or composition to the subject, where the immunostimulatory nucleic acid or composition is administered in an amount sufficient to prevent or reduce an antigen-specific response to the implant in the subject. The oligonucleotide and antigen-specific response to the implant in the subject. The oligonucleotide incompositions of the invention are useful for treating allergies, asthma, autoimmune of the invention are useful for treating allergies, asthma, autoimmune composition are useful for treating allergies, asthma, autoimmune neuropathies such as Gaillain-Barre, autoimmune thrombocypenia, temporal arterties, systemic lupus erythematosus, multiple sclerosis, temporal arterties, anti-phospholipid syndrome, psoriasis, pemphigus vingaris, vasculties such as Wegener's granulomatosis, utcoimmune compositions of temporal arterties, anti-phospholipid syndrome, psoriasis, pemphigus vulgaris, vasculties and as Wegener's granulomatosis, utcoimmune composities and as Wegener's granulomatosis, utcoimmune mediated diabetes mellitus, grave's biesase, leading allergies autoimmune composities and as a parkylosities, autoimmune composities and as a paganese of the adrend glabetes mellitus, grave's biesase, leading allergies, autoimmune comp polymyositis, dermatomyositis, spondyloarthropathies such as ankylosing spondylitis, and Sjogren's syndrome. The autoimmune disease is caused by an infection e.g. Lyme disease. This sequence represents an oligonucleotide used in experiments in the examples of the present

The present invention describes the human FD 17 protein (I). (I) has extostatic, virucidal, immunomodulatory, antiinflammatory and haemostatic activities. The polynucleotide encoding (I) can be used in gene therapy. (I) and the polynucleotide encoding it are applicable in the diagnosis and treatment of malignant tumour, haemopathy, human immunodeficiency virus (HIV) infection, immunological diseases and various inflammations. The present sequence represents a PCR primer for human FD 17, which is used in an example from the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New polypeptide-human macroprotein 21.78 and polynucleotide encoding it, for treating diseases such as embryo development teratogenesis and tumor.
                                                                                  New human polypeptide FD 17 for diagnosing and treating malignant tumor, hemopathy, human immunodeficiency virus (HIV) infection, immunological
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present invention describes human macroprotein 21.78 (I). Also described is a process for preparing (I) using DNA recombination techniques. (I) and the polynucleotide sequence encoding it (II) can be used in the treatment of diseases such as embryo development teratogenesis and tumours. The present sequence represents a PCR primer for (I), which is used in an example from the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Human; macroprotein 21.78; embryo development teratogenesis; tumour;

gene expression - by amplification of mRNA followed
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               double-stranded cDNAs by using an aggregate of mRNAs and a plural type of labelled reverse transcription primers (GENESEQ files AAQ75547-Q75798) and using the aggregate of mRNAs as the template for each reverse transcription primer; (b) digesting each of the prepared aggregates of the double-stranded cDNAs with restriction enzyme and; (c) electrophoresing the digested aggregate of cDNAs in seperate lanes. The method can be used to analyse gene expression rapidly and easily
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    A method for the analysis of cDNA comprises (a) preparing an aggregate
                                                                                                                                                                                                                                                                                         Analysis; gene expression; reverse transcription; primer; cDNA; aggregate; restriction enzyme; ss.

                                                                                                                                                    Analysis of cDNA and gene expression - by amplification of mRNA followed by digestion with restriction enzymes.
                                                                                                                                                                                                   A method for the analysis of cDNA comprises (a) preparing an aggregate of double-stranded cDNAs by using an aggregate of mRNAs and a plural type of labelled reverse transcription primers (GENESEQ files AAQ75547-Q75798) and using the aggregate of mRNAs as the template for each reverse transcription primer; (b) digesting each of the prepared aggregates of the double-stranded cDNAs with restriction enzyme and; (c) electrophoresing the digested aggregate of cDNAs in seperate lanes. The method can be used to analyse gene expression rapidly and easily

                                                                                                                                                                                                                                                                                                                          ö
                                                                                                                                                                                                                                                                                          A method for the analysis of cDNA comprises (a) preparing an aggregate of double-stranded cDNAs by using an aggregate of mRNAs and a plural type of labelled reverse transcription primers (GBNESEQ files AAQ75547-Q75798) and using the aggregate of mRNAs as the template for each reverse transcription primer; (b) digesting each of the prepared aggregates of the double-stranded cDNAs with restriction enzyme and; (c) electrophoresing the digested aggregate of cDNAs in seperate lanes. The method can be used to analyse gene expression rapidly and easily
                                                                                                                                                                                                                                               Analysis of cDNA and gene expression - by amplification of mRNA followed

```
A method for the analysis of cDNA comprises (a) preparing an aggregate of double-stranded cDNAs by using an aggregate of mRNAs and a plural type of labelled reverse transcription primers (GENESEC files AAQ75547-Q75798) and using the aggregate of mRNAs as the template for each reverse transcription primer; (b) digesting each of the prepared aggregates of the double-stranded cDNAs with restriction enzyme and; (c) electrophoresing the digested aggregate of cDNAs in seperate lanes. The method can be used to analyse gene expression rapidly and easily
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            턩
                                                                                                                      ilysis of cDNA and gene expression - by amplification of mRNA followed digestion with restriction enzymes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Analysis of cDNA and gene expression - by amplification of mRNA followed
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              A method for the analysis of cDNA comprises (a) preparing an aggregate of double-stranded cDNAs by using an aggregate of mRNAs and a plural type of labelled reverse transcription primers (GENESEQ files AAQ75547-Q75798) and using the aggregate of mNAs as the template for each reverse transcription primer; (b) digesting each of the prepared aggregates of the double-stranded cDNAs with restriction enzyme and; (c) electrophoresing the digested aggregate of cDNAs in seperate lanes.                                                                                                                                                                                                                                                                                                                                                                                                                        A method for the analysis of cDNA comprises (a) preparing an aggregate of double-stranded cDNAs by using an aggregate of mRNAs and a plural type of labelled reverse transcription primers (GENESEQ files AAQ75547-Q75798) and using the aggregate of mRNAs as the template for each reverse transcription primer; (b) digesting each of the prepared aggregates of the double-stranded cDNAs with restriction enzyme and; (c) electrophoresing the digested aggregate of cDNAs in seperate lanes. The method can be used to analyse gene expression rapidly and easily
                                                                                                                                                                                                                                                                                                                                                                       Analysis of cDNA and gene expression - by amplification of mRNA followed by digestion with restriction enzymes.

A method for the analysis of cDNA comprises (a) preparing an aggregate of
                                                                                                                                                                                                                                                                                                                                                                                   5
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     - by amplification of mRNA followed
                                                                                                                                                                                                                              by amplification of mRNA followed
                                                                                                                                                                                                                                                                                                                                                                             A method for the analysis of cDNA comprises (a) preparing an aggregate of double-stranded cDNAs by using an aggregate of mRNAs and a plural type of abable-stranded cDNAs by using an aggregate of mRNAs as AAQ75547-Q75798) and using the aggregate of mRNAs as the template for each reverse transcription primer; (b) digesting each of the prepared aggregates of the double-stranded cDNAs with restriction enzyme and; (c) electrophoresing the digested aggregate of cDNAs in seperate lanes. The method can be used to analyse gene expression rapidly and easily
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gapa
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Analysis; gene expression; reverse transcription; primer; cDNA; aggregate; restriction enzyme; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Reverse transcription primer used in cDNA analysis technique.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Analysis of cDNA and gene expression - by amplification of mRNA followed by digestion with restriction enzymes.
double-stranded cDNAs by using an aggregate of mRNAs and a plural type of labelled reverse transcription primers (GENESEQ files AAQ75547-Q75798) and using the aggregate of mRNAs as the template for each reverse transcription primer; (b) digesting each of the prepared aggregates of the double-stranded cDNAs with restriction enzyme and; (c) electrophoresing the digested aggregate of cDNAs in seperate lanes. The method can be used to analyse gene expression rapidly and easily
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           A method for the analysis of cDNA comprises (a) preparing an aggregate of double-stranded cDNAs by using an aggregate of mRNAs and a plural type of labelled reverse transcription primers (GENESSE files AAQ75547-075798) and using the aggregate of mRNAs as the template for each reverse transcription primer; (b) digesting each of the prepared aggregates of the double-stranded CDNAs with restriction enzyme and; (c) electrophoresing the digested aggregate of CDNAs in seperate lanes. The method can be used to analyse gene expression rapidly and easily

A method for the analysis of cDNA comprises (a) preparing an aggregate of double-stranded cDNAs by using an aggregate of mRNAs and a plural type of labelled reverse transcription primers (GENESEQ files AAQ75547-Q75798) and using the aggregate of mRNAs as the template for each reverse transcription primer; (b) digesting each of the prepared aggregates of the double-stranded cDNAs with restriction enzyme and; (c) electrophoresing the digested aggregate of cDNAs in seperate lanes. The method can be used to analyse gene expression rapidly and easily
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Analysis of cDNA and gene expression - by amplification of mRNA followed by digestion with restriction enzymes.
                                                                      cDNA and gene expression - by amplification of mRNA followed
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              A method for the analysis of cDNA comprises (a) preparing an aggregate of double-stranded cDNAs by using an aggregate of mRNAs and a plural type of ababled reverses transcription primers (GENESEQ files AAQ75547-Q75798) and using the aggregate of mRNAs as the template for each reverse transcription primer; (b) digesting each of the prepared aggregates of the double-stranded CDNAs with restriction enzyme and; (c) electrophoresing the digested aggregate of cDNAs in seperate lanes. The method can be used to analyse gene expression rapidly and easily

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          A method for the analysis of cDNA comprises (a) preparing an aggregate of double-stranded cDNAs by using an aggregate of mRNAs and a plural type of labelled reverse transcription primers (GENESEC files AAQ75547-Q75798) and using the aggregate of mRNAs as the template for each reverse transcription primer; (b) digesting each of the prepared aggregates of the double-stranded cDNAs with restriction enzyme and; (c) electrophoresing the digested aggregate of cDNAs in seperate lanes. The method can be used to analyse gene expression rapidly and easily
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Analysis of cDNA and gene expression - by amplification of mRNA followed by digestion with restriction enzymes.
